Dear Sir / Ma'am,
Subject: Transcript of Earnings Call held on February 11, 2026
Ref.: Regulation 30 of the SEBI (Listing Obligations and Disclosure Requirements) Regulations, 2015 ("Listing Regulations")
Dear Sir/Madam,
Further to our letter dated February 5, 2026 pursuant to Regulation 30 and other applicable provisions of the Listing Regulations, please find enclosed herewith the transcript of the Earnings Conference Call held on February 11, 2026, in respect of the Unaudited Financial Results of the Company for the quarter and nine months ended December 31, 2025.
The transcript can also be accessed on the Company's website at the following link:
https:/ /jainmetalgroup.com/results-announcements.php
Kindly take the above information on records.
Yours faithfully,
For JAIN RESOURCE RECYCLING LIMITED
BIBHU KALYAN RAUTA
COMPANY SECRETARY AND COMPLIANCE OFFICER

"Jain Resource Recycling L imited
Q3 FY '26 Earnings Conference Call "
February 11, 202 6
"E&OE - This transcript is edited for factual errors. In case of discrepancy, the audio recordings uploaded on the stock exchange on February 11, 202 6, will prevail."

MANAGEMENT : MR. KAMLESH JAIN – CHAIRMAN AND MANAGING DIRECTOR – JAIN RESOURCE RECYCLING LIMITED
MR. MAYANK PAREEK – JOINT MANAGING DIRECTOR – JAIN RESOURCE RECYCLING LIMITED
MR. HEMANT JAIN – EXECUTIVE DIRECTOR AND CHIEF FINANCIAL OFFICER – JAIN RESOURCE RECYCLING LIMITED
MR. SANCHIT JAIN – EXECUTIVE DIRECTOR – JAIN RESOURCE RECYCLING LIMITED
SGA – INVESTOR RELATION ADVISOR – JAIN RESOURCE RECYCLING LIMITED

MODERATOR : MR. ABHISHEK MEHRA – DAM CAPITAL ADVISORS LIMITED

Moderator: Ladies and gentlemen, good day and welcome to Jain Resource Recycling Limited Q3 FY26 Earnings Conference Call , hosted by DAM Capital Advisors Limited. As a reminder, all participants' lines will be in listen -only mode, and there will be an opportunity for you to ask questions after the presentation concludes. Should you need assistance during this conference call, please signal an operator by pressing star then zero on your touchtone phone. Please note that this conference is being recorded.

I now hand over the conference to Mr. Abhishek Mehra from DAM Capital . Thank you, and over to you, sir.

Abhishek Mehra : Good morning, everyone. Welcome to Jain Resource Recycling Limited Q3 results conference call. From the management side, we have with us Mr. Kamlesh Jain, Chairman and Ma naging Director; Mr. Mayank Paree k, Joint Managing Director; Mr. Hemant Jain, Executive Director and CFO; Mr. Sanchit Jain, Executive Director. Without taking any more time, I will hand it over to Mr. Kamlesh Jain for his opening remarks. Thank you and over to you, sir.

Kamlesh Jain: Thank you and a very good morning to everyone. Welcome to Jain Resource Recycling Limited's quarter three and nine months FY26 earnings conference call. I am Kamlesh Jain, Chairman and Managing Director of the company. Joining me today are Mr. Mayank Par eek, Joint MD; Mr. Sanchit Jain, ED Director and Head of Operations ; Mr. Hemant Jain, Executive Director and CFO; and other senior members of our team, along with our Investor Relation s Advisor s, SGA. Thank you for taking the time to join us an d for your continued interest in Jain Resource Recycling.

As many of you know, our group's journey began in 1953 and over the decades we have evolved into one of India's leading non -ferrous metal recycling platforms with capabilities across lead, copper, aluminum, plastic, and now in tin recovery. Today our busin ess is built on three core strengths: deep global sourcing, strong processing scale, and quality delivery to customers across international markets.

For the nine months of FY26, we delivered a strong performance with robust growth across revenues, which grew by 38%, EBITDA which grew by 65% along with a margin improvement of almost 116 basis points to 7% EBITDA. The PAT for the period grew by 65% and m argin improved by 71 basis points to 4.4%. This growth was supported by healthy volumes, disciplined hedging practices, and improved operating leverage.

Strategically, FY26 has been a very important year for us as we are executing a clear roadmap that goes beyond scale in the recycling. We always work on two dimensions for growth. While growth plans are volume drivers aimed at establishing new business verticals leading to a top -line growth, and few others are profitability drivers aimed at improving the bottom line rather than the top line.

The value -added copper products projected in Jain Green Technologies is a profitability driver through forward integration in copper and value -added product capabilities. We believe it will create a stronger and more resilient earning profit s over the medium term. Copper is our biggest

strategic priority. We are working on a two -part copper expansion roadmap. The first part is to strengthen our copper processing and scrap recycling platform. The second part is to move meaningfully into value -added copper products such as anodes, cathodes, wire rods, busbar, profiles, and coated products. This transition is important because it reduces cyclicalit y, improves product mix, deepens customer stickiness, and supports margin expansion.

Another profitability -driven expansion is extracting antimony from lead scrap bullion obtained from lead -acid batteries. This is a new concept in India and has the potential

to realize far higher value from antimony by separating it from lead. Alongside this, we also continue to strengthen our lead recycling ecosystem and raw material security through international partnersh ips.

During the period, our board has considered an d approved a strategic investment proposal to acquire a 25% equity stake in M /s. Abraj Al-Khaleej , Kuwait.

This is a volume -driven expansion and is expected to support our expansion in the Middle East by leveraging the investee company's established operations and local market knowledge and customer base. The upcoming copper recycling plant under Jain CY Circular Solutions Private Limited, a joi nt venture with CNY Global USA and is another volume -driven project.

Finally, our strategy remains aligned with long -term sustainability and circular economy goals. We are also evaluating additional growth opportunities such as scrap yard acquisition and new recycling verticals including tire, e -waste, solar panel recycling in a calibrated manner. With this, I will now hand over the call to Mr. Mayank Pareek , our Joint Managing Director, who will take you through the key business updates and project execution and outlook.

Mayank Pareek: Thank you, Kamlesh ji and good morning everyone. I suppose I am audible. I will take you

through the operational performance, key strategic initiatives and our outlook across major business segments. At an operational level, our performance in quarter 3 and 9 months of financial year 2026 continues to benefit fr om three structural advantages.
First, a diversified product portfolio across copper, lead and aluminum. S econd, a strong export footprint supported by long -standing customer relationships and third our deep sourcing capabilities with procurement across 120 plus countries and a broad supplier base. As Kamlesh ji highlighted, our strategy to grow new businesses has two dimensions: volume growth and profitability growth.
Our value -added copper project at Jain Green Technologies Unit 3, a profitability -centric project is progressing well. Construction progress as of December 2025 stands at approximately 80%. This project has five parts anode, cathode, wire rods, busbars and profiles, and tin silver coating. We have started receiving deliveries of critical machineries , with machines of anode and cathode production sections already delivered at site and machines for wire rod, busbar and coating sections expected to be delivered by the end of quarter 4 financial year 2026.
Importantly, Phase 1 of this project is being funded entirely through internal accruals, with total capex planned at somewhere around INR95 crores and around INR57 crores are already spent till December 2025.

This reflects our focus on disciplined capital allocation and balance sh eet strength even while scaling. T he project is being commissioned in a phased manner. The copper anode phase is expected to commence in February 2026 with an installed capacity of 800 tons per month, while the copper cathode phase is expected to be commissioned in March 2026 with an insta lled capacity of 750 tons per month.
The capacity of the anode section is expected to be doubled to 1,600 tons per month in Q1 financial year 2027. The capacity of the cathode section will also be doubled to 1,500 tons per month by quarter 3 FY27. The other three parts of the project, namely wire rod, busbar and profile and coating are expected to be commissioned in Q1 FY27, with monthly capacity of 600 tons of wire rods and 500 tons of busbar.
Over time, this forward integration will significantly expand our capabilities and improve our ability to offer a wider portfolio to bot h domestic and export customers. The copper recycling plant under the joint venture with CNY Group Investments I ncorporation is being set up in Ahmedabad under a newly incorporated company

, Jain CY Circular Solutions Private Limited.
The company has finalized four -acre premises on lease and commenced machine ordering. The plant capacity is 72,000 metric tons per annum of scrap processing, including 36,000 metric tons of motor, alternator, starter scrap, 24,000 metric tons of cable scra p and 12,000 metric tons of other scrap. This is expected to translate into approximately 25,000 tons per annum of processed copper and copper ingots.
The plant is expected to be operational in phase d manner starting from June 2026 and this will meaningfully strengthen our copper sourcing and processing ecosystem. This project assumes significance from the perspective of rapid volume growth. Kamlesh ji also mentioned the new venture for battery recycli ng in Kuwait. The project is expected to be up and running in quarter three FY27 with an installed processing capacity of 2,000 tons of battery scrap per month.
In lead, our focus remains on strengthening raw material security and increasing value extraction from lead -acid battery streams. Beyond lead metal itself, lead -acid battery scrap contains valuable byproducts such as tin and antimony. Tin extraction is alr eady implemented and scaling up steadily. The next value unlock is antimony extraction. We have now secured access to the niche technology required for this segment.
The plant commissioning timeline is quarter three financial year 27. The plant will process 1,000 metric tons of lead -antimony bullion with expected output of approximately 100 tons of antimony per month. Estimated capex for t his project is around INR20 crores. In tin, during the year we installed an additional vacuum distillation furnace, taking our tin capacity from 125 metric tons per annum to 500 metric tons per annum.
This enhances our ability to meet demand with better consistency, improves output stability and supports profitability through better realizations. In parallel, we remain open to calibrated expansion into new recycling domains such as tires, solar panels, aligned with India's evolving recycling policy framework and EPR -driven ecosystem. With this, I will now hand over to our CFO, Mr. Hemant Jain, who will take you through detailed financi al performance for quarter 3

and 9 months financial year 2026 along with volume, margin, and working capital trends. Over to you, Hemant.

Hemant Jain: Thank you, Mayank sir and good morning everyone. So I'll take you through the financial performance for the quarter and the 9 months ended on 31st December 2025. So starting with the c onsolidated performance for 9 months FY26, the company delivered strong growth across key financial parameters.

Consolidated revenue from operations stood at approximately INR6,438 crores compared to around INR4,669 crores in 9 months FY25, representing a year -on-year growth of approximately 38%. Volume growth for this period stood at around 29.34% while balance is due to the value growth. The EBITDA for the nine months FY26 came in at approximately INR449 crores compared to INR272 crores in the corresponding period last year, translating into a growth of approximately 65%.

EBITDA margin impr oved to approximately 7% in 9 months FY26 versus 5.8% in 9 months of FY25, supported by better operating leverage, improved product mix and stable execution. The profit after tax for the 9 months FY26 stood at approximately INR281 crores compared to INR171 crores in 9 months FY25, representing a year -on-year growth of around 65%. And the PAT margin stood at approximately 4.4% in 9 months FY26 compared to 3.7% in the corresponding period last year.

So for Q3 FY26, our profitability continued to remain healthy. The company delivered EBITDA margin of approximately 7.2% and the PAT margin of approximately 4.5% compared to EBITDA margin of 5% and the PAT margin of 3.3% in Q3 of FY25. So this r

eflects the
continued improvement in the operational efficiency and profitability.

From a business mix perspective, during 9 months FY26, copper and copper alloy products contributed approximately 52% of the total revenue, while lead and lead alloy ingots contributed approximately 43%, while aluminum and aluminum products contributed approximately 4% of the revenue.

Our revenue mix continues to be export -led with 70% revenue coming from the exports, while 30% is from the domestic ma rket in the 9 months of FY26. In addition to this financial growth, our business continues to scale meaningfully in volumes. As per the presentation, we have disclosed the seg ment volumes for Q3 and the 9 months across copper, lead, and aluminum. We have also disclosed the EBITDA per ton for each segment for both Q3 and the 9 months. These metrics reflect that our margin improvement is not only driven by the price, but also by better throughput, operational discipline and the product mix. As on December 25, our return on equity stood at around 30.1%, while return on capital employed stood at 24.95%.

On working capital cycle, we continue to remain focused on maintaining efficiency despite business scale -up. Given the future nature of recycling business, our working capital is structurally linked to raw material sourcing cycles, inventory holding of scr aps and the export receivable timelines.

As per historical disclosures, working capital days remained under control and we continue to monitor the inventory days, debtor days and the creditor days closely to ensure the liquidity remains comfortable while we scale up the volumes. As on December 25, inventory days stood at around 90 days, debtors stood at around 24 days, while the creditors days stood at 32 days. So overall cycle stood at around 82 days.

Coming to the utilization of the IPO proceeds of primary issue of INR500 crore s, INR375 crore s was utilized to repay the bank debt and the balance INR125 crore s was embarked for general corporate purpose, of which INR98.6 crore s was utilized after incurring the IPO -related expenses.

Subsequently, the repaid bank limits have been re -availed to support higher working capital requirements arising from the rise in the copper prices by around 40 % to 45%. A key point to highlight is that our hedging mechanism plays an important role in protecting the profitability and stabilizing the cash flows.

Since our business is linked to the LME pricing, we typically hedge through short positions in future contracts while locking in final sale values, which helps us to reduce volatility and improve predictability. We remain focused on ensuring project execut ion stays within planned timelines and budgets while maintaining healthy leverage metrics.

So now to conclude, the company has delivered a strong quarter and a strong 9 -month performance and we remain confident in the long -term strategy, backed by strengthening raw material security, forward integration into higher value -added copper products and disciplined execution across both operation and capital allocation. With th at, I hand over back to the

moderator for this call. Abhishek, over to you.
Abhishek Mehra : We can open the floor for questions, please.
Moderator: Thank you very much. We will now begin the question and answer session. Anyone who wishes to ask question may press star and one on their touch tone telephone . If you wish to remove yourself from the question queue, you may press star and two. Participants are reque sted to answer while asking a question . Ladies and Gentlem en, we will wait for a moment while the question queue assemble s. The first question is from the line of Rahul from Lucky Investment Management. Please proceed.
Rahul: Thank you for taking my question, sir, and apologies for a bad throat. Congratulations on a very, very

good set of numbers, in fact, a great set of numbers. Two questions, sir. One, the working capital cycle has seen a material expansion. We generally talked about 45 to 50 days as a general rule, rule of thumb and now we're talking more like 80 days. Any sense that you can give here on when do we see normalization?
Kamlesh Jain: Yes, so I will reply your questions. This time the working cycle has happened a little longe r because one was the New Year. S o a lot of the collection got stopped because of China and the other countries. And there was almost even the European and all, they don't work for long in the New Year period . And second was the due to the -- we have taken a ver y huge tender and that

has come, I mean, the huge quantity of copper has come together and in that, the inventory has pushed the -- our to tal working cycle requirements.
So it has got delayed also. And one more reason is the compared to the lead last year, this time the copper is predominating and copper is the major part of the sale. Copper cycle is not as fast as lead cycle. The lead payment introduction comes faster tha n copper. Copper payment comes only when the material reaches to China and the other countries.
So copper is now taking the lead, so that is why the working capital cycle in copper is larger than the lead. So there are some -- to consolidate to conclude is that there are three important reasons: one is the New Year holidays and the collection has got not received; second is the copper due to copper very volatile price, the collections are dropped also and got delayed because our buyers have to pay the margin call to their exchange, so they had little delay in that; and third is the lead , compared to the lead, copper collection takes little more time.
But I'm sure that this collection will improve in the next quarter, you will see better days will come because I don't think any more cyclical or the price volatile movement is there. So it is got settled now. So you will see the better these collection da ys will drop now from 82 to might be, I think it will improve much more days. What was the second question, Rahul?
Rahul: Sir, the second question was on the copper per ton EBITDA number. Last quarter we had seen a number of about INR51,000 a ton and that had expanded based on what had happened in terms of the import duty on copper scrap. This quarter we have seen that number go down to more like INR42,000 a ton. Where do we see this settle down, sir?
Kamlesh Jain: Hemant, would you like to reply this EBITDA per ton?
Hemant Jain: Yes, so Rahul, last year as you rightly said we have shown an EBITDA per ton of INR50 to INR51 , but if you see on a consolidated basis for the 9 months of FY26 we are still at around INR46, INR47 -- sorry, INR46,000 or INR47,000 per ton.
So we estimate that this will -- the EBITDA for copper will be there in the range of around 48,000 to 50,000 and this will see stability. But because of this price rise and the steep price rise in copper for the last quarter, this has got reduced to some extent, but I think it will get stable down at around 48 to 50 in the coming future.
Rahul: Just as add -on to this, sir, does the volatile price movement cause a problem with the hedging mechanism, which is why we have seen this come down from , let's say , 51 to 42 , just to get a sense?
Hemant Jain: No, as per our hedging mechanism, we have already explained that we even hedge the gross margin. But what happens when there is a sudden price rise, the re is a smaller impact on the margins of the copper usually when we hedge for the profit. So the gross margins in numbers gets reduced, but as I told you on 9 months basis it's around 46, 000, 47,000 per ton and it will stabilize. And the margin -- our hedging practices are still well disciplined where we protect the margins well r

ight from the d ate we purchase the raw material. So you won't see much of volatility in the coming future.

Rahul: Great, sir. Thank you for answering my questions.
Moderator: Thank you. The next question is from the line of Vivek Gautam from GS Investments. Please proceed.
Vivek Gautam: Yes. Just wanted to know about the -- our differentiator for our company versus competition and expected growth rate and opportunity size for us ?
Kamlesh Jain: You mean to say the future growth rate and the competition from the outside?
Vivek Gautam: No, the differentiator what is -- what helps our company , what distinguishes our company from the competition, what are our moat and edge you can say, USP you can say?
Kamlesh Jain: Yes, okay. So as we have even told in IPO presentation and subsequent meetings also, that Jain is a completely multi -commodity recycling company. So if you see the -- our other business peers, they are strict to one or two metals, but we are almost in six metals and we are increasing our portfolio of metals.
So this one of the USP where the byproducts are not sold as consumed inside and including the plastic recycling, which is the unique one we have and that help us to maintain an edge over the competition and zero waste, zero landfill, zero burning gives a g reat advantage in that way. And also, we use only green fuel which is environment friendly so cost reduced also by that way.
So Jain has got many other USPs of like hedging mechanism, a robust mechanism, and deep sourcing of raw material, buying from ex-yard, buying from direct source and selling to the LME registered brand and selling to globally and multi -product commodity and a strong motivated team to handle the operations.
So there are many USPs we have. And apart from that, the growth is of course, if you see our historical growth, we've been growing from around 40 %, 50% year -on-year from last 10 years and basically, it's like a unicorn when we started this company 10 years back, recycling business, and we come to a $1 billion plus valuation in this 10 years' time.
And I believe that we will be keep growing at same historical growth only and there are the rapid expansions are going to come in the next year. The next year will be very , very, very promising year for us, I must say that, because we are coming with four new verticals which I've told also in my initial speech.
That so we are going to start our Ahmedabad plant by June, which is a US joint venture, and we are going to start our Kuwait plant by November -December, and we are going to start our cathode plant by -- February anode and March by cathode and April we start wire rod and then we start busbar. So every month one product will keep get rolling. So that plant also on the right track.
And also , we are looking for some acquisition and all . So four new verticals are going to start the next year plus looking for the somewhat I mean the inorganic growth or we might go for acquisition. So I am very confident that my growth, whatever historical will be maintained and

it will be definitely we achieve that. There is no , I mean , I'm very confident -- very, very confident on that about the future growth and we are going to maintain the historical growth of 40%-50%.
Last year we grown 60% . In fact, we have projected only 20% growth in our last presentation , but we have grown , I mean , 38% by December and our PAT growth was phenomenal. So I have , I mean , I can assure the investors that there won't be any problem in the growth side.
Vivek Gautam: Sir, I was reading somewhere that now it takes nearly 27 years for a new copper mine to come on stream and the easy copper availability has gone from the earth's crust. And with that in mind, how are the prospect looking for our r

aw material in recycling s ector and where do we source from this copper raw material, sir? What is our edge in that?
Kamlesh Jain: So that's advantage for us when there is a shortage of copper mines and new mines are not coming because of the raw material, because of the environment and many other issues and poor quality of copper ore and the cost is going up, it's good for recycling business. So that is -- it is good for recycling business when the mines are not able to conduct or expand their operations.
And we are sourcing from world over and today's world recycling is the only way to live the life on this planet. There is no other way. Recycling as I told , earlier also, recycling is not a choice, it's a compulsion and we must do recycle, so it's good for us and we will be getting a better volume and better tonnage to expand our operations.
Vivek Gautam: How do we source the raw material, sir?
Kamlesh Jain: We already explained we source from 120 countries and we have ex-yard sourcing, we directly participate in tenders, global tenders, we buy from suppliers globally, so we're and we buy locally in India from all over from Kashmir to Kanyakumari, from everywhere we buy. So it is

a global sourcing and we have wide supplier network and we have a very strong team of traders to source the material.
Vivek Gautam: So we are number one in copper and other recycling companies , in the field of copper and other metals also, sir? Or...
Kamlesh Jain: I don't want to say number one or number two, but I will say that we are the largest company in recycling world of non -ferrous metals.
Vivek Gautam: Thank you, sir. Keep up the good work, sir.
Kamlesh Jain: Thank you.
Moderator: Thank you. The next question is from the line of Praful from Dymon Asia Capital . Please proceed.
Praful: Hi, good afternoon, sir. Many , many congratulations on a very strong execution after listing. Sir, just two -three key questions. One in terms of what are your capacities come online over next 6 to 12 months ? And given the backdrop, what can be the, you know, sustainable growth rate for Jain over next say 12 to 24 months in terms of top line, given the current assets that you will

sweat and incremental capacities, where are they coming and what size of opportunity they hold for us? That's the first question.
Kamlesh Jain: Yes, so to answer the first question is that about the future growth already I have to just mention that what type of growth I'm targeting and because of the new four verticals are going to come and execution of different plant as Kuwait and Ahmedabad and Chennai and existing capacity expansion also.
So, as I said, historical growth, whatever is there, it will be maintained and we might grow even more than that. But we always say , I mean , we always talk less and do more performance as you've seen the past projection also , we just said 20%. So growth -wise, I don't see any worry or any problem for that. The company is on robust path of expanding the operations and the growing. About this break -up of this data and whatever the tonnage side, I would like Mr. Mayank Par eek to address your question.
Mayank Pareek: Yes, so on the growth, as Kamlesh ji explained, the growth path will continue because we have all along been working on various segments for setting up new businesses, new verticals. So on capacity, what is your question exactly, Praful ji?
Praful: Sir, what all plants are coming in say next 12 months in terms of new capacities and capabilities and what potential they have in terms of revenue potential for Jain?
Mayank Pareek: Okay, so as I elaborated in my speech, I would just quickly repeat because our growth strategies are two -dimensional: one is profit -centric where we do certain things to increase the profit, and second is the volume -centric. Right now we are

actively worki ng on the value -added product project of Jain Green Technologies Unit 3.
As I mentioned, this project has five parts: copper anode, copper cathode, and then wire rod and then busbar and profiles and then coating. This project is going to be commissioned in this month with the start of anode production, and then next month would be cathode production . And within the quarter 1 of the next financial year, the other two parts, I mean the wire rod and busbar making will start.
This project is actually , does not add to the top line because we consume our own raw material, but then it has a huge potential of increasing the profitability because we get into the value -added products. In this project, we are immediately going in for expansion. For example, a node we are starting in this month, but we will immediately start working on the next expansion which will be completed in quarter 1 financial year '27.
Similarly, cathode again we will commission next month, but we will immediately go in for an expansion and we will complete it by quarter 3 financial year '27. Then Ahmedabad project, which is in joint venture with the American company C &Y Holding. This project is all about recycling copper scrap and producing high quality copper products, and this project has a total -
- will have a total capacity to produce somewhere around 25,000 tons of copper products per annum.

This will be commissioned in phase manner, but then the first phase will be commissioned in June 2026. So this project is going to add on the top line somewhere around maybe INR650 crores added to our balance sheet according to our ratio in the partnership. Then Kuwait, Kamlesh ji mentioned, Kuwait we have invested in a joint venture company for battery recycling

project . And this will help us increase volumes for the lead business.
Then antimony we mentioned , because the lead present in the lead -acid battery scrap has alloying elements which have a high value if we are able to extract them from the lead. Tin project already -- was already implemented. Now antimony extraction is a niche technology that was not available. We had been working pretty hard on this and we have been able to get access to this technology.
This project will be commissioned in quarter 3 financial year '27. So these are the four projects and these are the timelines. Antimony project is of course a profit driver project. So these are the projects that we are working on.
Praful: Superb. And sir , in terms of growth broadly and how should margins track and is there some technicality to margins in terms of booking of raw mat? And second on the sourcing strategy, if you were to grow say 30 % to 50% over next two years, how is the sourcing strategy, any new sourcing capabilities you have built locally or overseas?
Kamlesh Jain: I will reply this. So Praful, as your sourcing, as we have mentioned many times, that we have very strong team to source globally, around 120 countries, and we have around -the-clock our desk in hedging. So in that way we're quite strong and that is the key part of this recycling business, to source more and more and recycle them. About the technological side, we are not worried because we have all tie -up of technologies and for this all these whatever we are sourcing.
So before we start a new product, we go in depth of studying in this raw material and we understand deeply and then only we tie up with technology. About this margins side, as there are some verticals which will grow the top line, and there are some vertic al which will grow the bottom line. As copper cathodes and other things will grow definitely bottom line more than top line.
And copper antimony and of course this C&Y , the joint venture of Ahmedabad and Kuwait, Kuwait is kind of actually associate, so we will not have top line, it will only imp

act our bottom
line. And Ahmedabad if it will improve , will improve top line. All these four verticals will get implemented in next year and they are all on track and it will be I mean I'm very sure about this growth of the next year when this vertical will get start. Plus the existing capacities also will getting modernized and more efficiency in production capacities also will take place.
Praful: Sure. Sir, last question was on the cash flows and working capital as somebody asked before, over a medium term what should we think about working capital and free cash flow in the business?
Kamlesh Jain: So as I mentioned that we have got one huge inventory, so we've taken a big tenders and there was a you must have noticed the inventory has gone up very high because of this one -time

purchase we have done, and that is why the working capital cycle is getting more delayed. But this inventory will come down in next one or two months, is already started coming down . And by the next result, you will see a drastic drop in the inventory and that will improve the cash flow.
I'm sure that I think 50% of my EBITDA or at least PAT will be cash flow surplus by March. So I believe that 50% of the PAT will be a surplus in by the end of March when the inventory goes down. And this I'm pretty confident because we already have three months roadmap and we know that it is going to be under control. So I hope this satisfy your query?
Praful: Yes, sir. And the ROCE thus should go back to 25 %-30% range once the working capital gets fixed over next 3 -6 months?
Kamlesh Jain: Can you repeat? I just -- could not able to hear. Praful, I'm not able to hear you.
Praful: Yes, sir. I just sir the ROCE thus should look back to 25 -30 band where they used to be once the working capital settles?
Kamlesh Jain: Yes, of course. Of course. That's true assumptions. I mean we already -- I already mentioned in my speech that it is the ROCE this year up to now we have achieved a 30% ROE and once the inventory goes down, it will be better only. And I'm sure about the maintaining getting the ROI back to level. Better level.
Moderator: The next question is from the line of Chirag from Neo Asset Management.
Chirag: So just as you said that, you know, one of the reasons for decline in EBITDA per ton from 50 to 42,000 is, you know, because of the jump in copper prices. So assuming the scenario when the copper is in short supply and if the prices continue to go up, can we see a further reduction in your EBITDA per ton?
Kamlesh Jain: No, I don't think so EBITDA per ton is going to get reduced, and we will definitely maintain. And once our value -added plant start, which is from the next financial year April, definitely the EBITDA per ton will be better only because this is a value -added plant are coming. So I don't

think there's a fall, there's of course there will be increase in EBITDA per ton.
Chirag: Okay. And this antimony project, so you're saying that it would be 100 tons per month kind of, you know, output. So what could be the peak, you know, revenue potential from this project going forward maybe in 2 to 3 years down the line once it starts?
Kamlesh Jain: So right now it's very initial stage to comment and there are some of confidentiality so which I will not be able to disclose. If you can send me mail, we'll discuss on personally about this because right now I don't want to discuss on this call. And but I'm sure that this will be plus value -added metal for us and we are going to expand it big way.
Chirag: Sure. And lastly, sir, there were some SEBI investigation against the promoter for some, you know, market related things. So is it completely behind us or there could be some more negative surprises that can come up from this front?

Kamlesh Jain: Nothing like this, it's a 10 -year old matter and it has been we already file appeal and I think Hemant ready to take this because I think he's handling it.
Hemant Jain: Yes, so I think you are talking about the order which was received in December '25, right?
Chirag: Yes.
Hemant Jain: Yes, so that order we have already filed the appeal into SAT and we await the now hearing from the SAT Board so that we can put up the matter against them and all the proofs with respect to the to the case. So that we would not like to comment anything now as it is pending with the SAT Board.
Kamlesh Jain: It is only hardly a 10 lakh matter and it's a 10 years old matter, I tell you.
Hemant Jain: No, no, it is three years old matter and it's a small penalty. On a profit of around for INR10 lakh, they have penalized us for INR25 lakhs.
Chirag: And sir, your working capital cycle with the inventory going down, can it reduce to 40, 30 -40, 35-40 days which used to be previously or will it remain at elevated higher levels?
Hemant Jain: Inventory will come down as Kamlesh sir has already explained the roadmap for the next three months. So it will again will come back to around 35 to 40 days. So which will make this working capital cycle better in terms of presently 82 to it will fall to a round 60 -65 days back.
Moderator: The next question is from the line of Sumant Kumar from Motilal Oswal Financial Services.
Sumant Kumar: So when we talk about the recent joint venture, okay, so what is the thought process of doing joint venture when we have a capability and we have a rich experience of recycling copper?
Kamlesh Jain: So the we have done two joint ventures and we might do more also, but you understand that these are joint ventures are for geographical reasons. In recycling business, the raw material is very important as you all know . And there are some local strength s we have. Like what we have done in Kuwait, it's the first license our partner has got in Kuwait . And there is no other license available, and is only guy who -- because they give to the local Kuwaitis.
If we go and apply there, we won't be getting also because they don't want outsiders to come here. So we need to take a joint venture partner, In local and the local lot of local factors are also there about these country's laws, regulations, and there are many other things. So we mostly tie up with our suppliers only. We know these people from long time, they are not new to us. Like the C &Y joint venture was -- the CNY is known to us from decade .
10 years I'm buying raw material from them and then they want to come to India . And if I don't do, somebody else will do. So definitely it is a good for us because we know the people and if they are known friend to us for so many years. And second reason as Kuwait I said, these joint ventures give a local strength and a participation i n the their local market. So something we do go out of India

And like Kuwait if we apply , we won't be getting license to recycle . And there are many countries where if we apply license we won't be getting also. So that depend on the local factors, raw material situations, a technological tie -up, and many other factors. But overall, it's good for the company because recycling is coming under one umbrella and many small -- I mean the small JVs help us to grow more fast.
Mayank Pareek: I add just one thing to what Kamlesh Ji said. So our business, the most important is the raw material sourcing. Now we have full capabilities, but then if we have more raw material sourcing, we can increase our business more. Now as far as the C &Y joint venture is concerned, C&Y is a large company in USA which is having 11 -12 scrap yards and a large sourcing of raw material.
Now we already are not buying much of material from them, there is hardly

any buying from
C&Y. They wanted to come to India for a recycling facility and they want to have a joint venture partner. Now if we have joint venture with them, we have new source of raw material. And this increases the business volume. So despite our capability, we have n ew line of raw material and that's how this is the -- we get benefited from this joint venture. I hope I could reply to your yes.

Kamlesh Jain: You are correct partially. See, the one thing you have to understand that C &Y is a supplier to us and you are saying hardly they are getting material from them because they have also facility in Thailand and they are not happy because of the local Thailand costing and the local ecosystem because they don't have plastic ecosystem -- the labels are very high expensive, and the lot of other factors are there, so that is why they coming to India.

So it is not , of course, we will get benefited. India has got own strength in recycling this non - ferrous metal, that is why these overseas companies are coming to India and they want to tie up with us because of the we are the largest . And all these people are known to us. So what you said is right, but also they have own interest, it is not alone we are benefiting, they are also getting benefited by this.

Sumant Kumar: I'm talking about the copper EBITDA per kg, when we talk last three quarters, we have seen a very volatile EBITDA per kg. In Q1 we have a 38.5 per kg, then Q2 we have a 62.4 and then again Q3 it is a 42. So overall the volatility is higher, so what is the normal range of EBITDA per kg we can expect and why the volatility is?

Kamlesh Jain: Yes, so first I tell you why the volatility. The copper EBITDA moves because the formula moves up. Now I'm just telling simply when now this month as compared to the last quarter, this month this quarter EBITDA was low because the -- when we buy the raw material, our purchase formula is also linked to LME prices when it goes up and down. So the there's a ditch gap between the sale and purchase price.

So if we buy the suppose when the copper price goes up, the sale formula drops. This sale formula will again pick up I mean our margin is intact, but our this when the sale formula drop the purchase formula also will drop. But the drop and pick up will the re's a ditch gap because one quarter we will buy expensive material, the other quarter the cheaper one will come.

So 1% or 2% purchase cost varies which will get reflected in a whole year of average. Now average is generally I am confident over maintaining INR55 EBITDA per ton and our prediction what we given once our plant start for the value -added product, it might go to I think Hemant can clarify it's almost goes to INR70 -INR75. I think per ton once the value -added product start. But on an average INR50 to INR55 is achievable. Hemant, am I right? Can you correct me?

Hemant Jain: Yes, yes. So on an nine -month average we are still achieving it around INR47,000 per ton for the copper. So by removing this volatility of quarter -to-quarter if you can see on nine months average we are still at INR47,000 per ton and once this value -added product plant starts, it further rise up.

Sumant Kumar: So do you think 55 is very the higher expectation because we can see some more volatility going ahead and the margin EBITDA per kg margin will be around 45 % to 50%? That is a better estimate and better understanding?

Kamlesh Jain: No, I don't think so that volatility will impact the EBITDA so much. The impact is coming like one quarter goes up, another quarter goes down, on average you will get this 50 -55. As Hemant said, it will go up only. It will be on an uptrend only once the va lue-added plant started, and there is no chance it can go down because of the cost and other things are there and our margins are intact. If you see our PAT

margins or EBITDA margins are almost going up only. So there is no chance the EBITDA can fall.

Sumant Kumar: So when we are hedging the copper and the buying the -- we are also hedging and also a sale we are all both side it is hedged. Why so much difference despite what formula you're talking about? Difficult to understand when the ?

Kamlesh Jain: I got your question, but you're not focus ed on my reply when I said just said about that. There is a gap when you -- when we of course hedge the LME prices, but the formula of buying the material is little bit gets 1 % or 2% get fluctuated, which will impact the EBITDA. So as I said when the copper price goes up, so more the costlier metal lower the margin. Like say gold is higher costlier, the margins are very low in gold.

So it will always depend on the metal prices, the EBITDA per ton linked to the prices of the metal. Now what happens is that when we buy the raw material let's say we bought in the last quarter, that material will arrive after three months and processed and sold, that time if copper price goes up, the sale formula little bit fall by 0.5% to 1%. But in coordination to the sale formula, the purchase also will fall simultaneously but that material will come in the next quarter. So there's a ditch gap between the supply and production which will fluctuate the EBITDA, but ultimately on average of the year, it will get maintained or even six months average will get

maintained.
Sumant Kumar: Okay. So the lag effect of three months ...
Kamlesh Jain: You can call me personally Sumant right ? I will I will explain more by the numbers to you.
Sumant Kumar: Okay, no issue. Okay. Thank you. Thank you so much.

Kamlesh Jain: Thank you.
Moderator: The next question is from the line of Vedant from Nirmal Bang Securities Private Limited. Please proceed.
Vedant: Thank you for the opportunity. My question is on the margin front , like, what kind of EBITDA margins we are targeting going forward , when our all expansions come into picture? So how should we look at that?
Kamlesh Jain: So your voice is coming louder, I mean your voice not coming properly. You're saying about the margins EBITDA?
Vedant: Yes, yes. Correct.
Kamlesh Jain: I think we have already replied this question to you in detail in the previous questions , and I think you must have noticed that. So this question would have already replied. If you any if any more query you can send me an email, I will definitely reply more to you. But I think I replied you this.
Vedant: Okay, sir. Okay.
Kamlesh Jain: If any if more query you can ask the same reply we given to you already.
Moderator: The next question is from the line of Ajit Sethi from Eiko Quantum Solutions . Please proceed.
Ajit Sethi: Yes, sir. Thank you for the opportunity. Sir, for this upcoming four to five new verticals, so what is the total amount of capex we are spending , and how much we have already spent?
Kamlesh Jain: Mr. Mayank will take this question.
Mayank Par eek: Yes, so the total capex that we had planned for the value -added product project of Jain Green Technologies 3 was somewhere around INR100 crores. Out of which we have already spent somewhere around INR57 crores and in this financial year, we will spend another INR15 crores. So this project was planned for somewhere around INR100 crores, out of which by the end of this financial year, we would have spent somewhere around 70 crores and INR30 cror es will be spent the next year.
Now coming to the next financial year, the total capex including this INR30 crores is going to be in the range of INR100 crores plus INR7 to INR8 crores for Kuwait will be somewhere around INR110 crores. I suppose I have replied to your query?
Ajit Sethi: Yes, sir. Thank you, sir.
Mayank Pareek : Yes.
Moderator: The next question is from the line of An

kit from Market cord Research Private Limited. Please proceed.

Ankit: Yes, good morning. I have one question. See, as per the -- you mentioned that 70% of the revenues have come from exports, so based on the base of INR2,775 crores, it's around INR1,940 crores. Based on the trade databases available, the export revenue for your company was around INR2,300 crores. Is there a gap somewhere?
Kamlesh Jain: Hemant, can you reply this?
Hemant Jain: No, there is no gap at all. So for this quarter the revenue, overall revenue, whatever we have shown from that the 70% is from the exports. So can you just let me know from where you are referring this?
Ankit: Yes, I'm referring to the trade databases. I've sent out a mail to you as well. I will share more details on the mail as well.
Hemant Jain: Yes, you share the details over the email, we will reply you.
Ankit: Okay. Second question is with the tariff bill happening with USA, do you see a possibility of, you exporting to USA and will it come with a higher margin?
Kamlesh Jain: No, we don't expo rt to USA, we only buy from USA, that's why the whole US tariff game doesn't impact us at all. And we never been impacted by the US tariff issues. And we never export to US so far. And in fact, even though this tariff what government given exemption but the duty on the section 232 which is not giving exemption to duties on copper, aluminum, steel, and many other products. In fact, we are not exporting to USA, so we don't have connection, but for the information, this tariff do n't give exemption to steel and copper and al l.

Ankit: Okay. And one last question is obviously you have tried to do a venture in Sharjah, which was later divested, right? And now we are trying to do a venture for investment in Kuwait. So what gives us the confidence that, we'll be possibly having a better out put this time?
Kamlesh Jain: So Kuwait is our own business. It is not something new vertical what we are doing. It's just a battery recycling what we are going to do , and that raw material is going to come to our Indian plant to make it into lead ingot. We are not putting a full -fledged plant, we just battery recycling there and I don't think its new business so it's mean any challenge for us is there, because we have local partner to take care of the local issues and we are just want to do the production and bring b ack the material to India.
Ankit: Thank you.
Moderator: The next question is from the line of Manish Os twal from Nirmal Bang Securities Private Limited. Please proceed.
Manish Ostwal: Yes, sir. Thank you for the opportunity. I'm new to this company. So my first question is in our recycling business, sir, if I compared the global benchmark company , to whom should I compare and as a management team where you compare your practices and systems in the recycling business, sir?
Kamlesh Jain: You want you are saying that global companies , do you want us to compare?

Manish Ostwal: Yes, yes, if because we will be sourcing in the global market only, right, sir?
Kamlesh Jain: So basically we don't have any big peers in India for copper business, and for lead of course there are listed space are there which you can always compared our data with the listed companies. And as far as the global companies are concerned, we have compe tition from Thailand and some something Malaysia , but mainly from Thailand companies.
And I don't think , every , I mean there is a everybody's got own space in recycling because India has got unique ecosystem which lacks in other countries , and that is why Indian companies are growing so fast in recycling. And globally the local recycling happening , of course , like, in Europe the people do themselves recycling , and so people do recycling in their

own country, but
as I said , there is no like apple -to-apple comparison of the global companies here.
Manish Ostwal: Okay. And secondly, sir, in our business like critical , you said , the procurement is the most critical aspect of business activity. Any other key KPIs which you track as management team , which as an investor we need to track down on a yearly or quarterly basis?
Kamlesh Jain: What we do that, to elaborate you more, we have a six -seven strong traders team who've been trained very aggressively in our Chennai plant , and they travel global to source the raw material to different countries and they stay , and they go to the scrap yards, they see the tenders, and they negotiate on behalf of the company . And that is the strength we have , because we buy round the clock right from Australia to China to , I mean , to Indian local market to Middle Ea st to Far East to Europe to US.
So we buy by the sun, then the sun get up by 5 sun rises 5 AM our purchase start and the night the US gets close down the purchase doesn't get stop. So purchase , round the clock , we purchase.
And that's the uniqueness because the world over we are sourcing the raw material and India is -- and this kind of recycling can happen only country like India because of the many strength which I've already , mentioned the cheaper labor or the ecosystem of plastics , and the infrastruct ure, and the many other factors.
So this European countries or US countries cannot do at the cost what India can do , and that is the strength of the recycling of Indian market , and we have a strong team for sourcing. And once we source we also need a bigger infrastructure to recycle this , and we have like 5,000 labor, 60 acres of land, and many other many other USPs which I've told you , that bring the Jain on top of the recycling sector.
Manish Ostwal: All right, sir. After conducting our own public domain study , we will connect you to deeper understand the business. Thank you.
Kamlesh Jain: Sure.
Moderator: The next question is from the line of Priyanshu from Investec. Please proceed.
Priyanshu: Hello team. Couple of question from my side. So first of all, I want to get understand about our hedging mechanism. So for one ton of copper sale, how much quantity we long on the LME ?

And how much input output ratio basically we take into consideration while hedging? That was my first question.

Kamlesh Jain: I'm saying that this for this is , if you want to understand elaborately, I think we will do , I mean you can call me personally or our email to me. I'll send you how we do this , because it's a very long answer , and it's -- like there's a lot of Excel working behind this, which I can't explain over the phone. So I would like you to as k personally this.
Priyanshu: Sure, sir. And secondly, how we look at our EBITDA margin , once our value -added product mix will get intact? Sorry for the repetition of my question. I joined late , but how we look at our EBITDA margin.
Kamlesh Jain: Okay, Hemant can reply this.
Mayank Pareek: No, let me respond to this. Let me respond because this is pertaining to the projects that we are coming out with. So if you look at the nine months, EBITDA margin is somewhere around 7% and going forward you are talking about the value -added products, what wi ll be the impact. So in overall turnover, because value -added products have two projects, one is the copper value -added product project which is going to be commissioned very soon, second is the antimony that we are coming out with, and all this put together in overall term , these has potential -- these two projects have potential to add to the EBITDA margin up to 1% for the overall company.
Priyanshu: Sure, sir. And secondly just follow up, so are we seeing any improvement in raw material sources from the domestic market given the

EPR and other regulations coming in? So how much are raw material sourcings from the domestic market?
Kamlesh Jain: Our domestic sourcing is increasing every year on year. If you see the past data and this current year data, which is already mentioned in -- I think in the listed exchange. It's there in the presentation. You can see that, so our domestic sourcing is going up , and in the presentation , we elaborately told how much is go ne up our purchase has gone up.
Hemant Jain: So presently, just want to add here, presently it is domestically we source around 44% of our raw material volume.
Priyanshu: Okay. Thank you, sir. That's all from my side. Thank you.
Moderator: Thank you.
Moderator: Ladies and gentlemen, due to time constraints that was the last question for today. I now hand over the conference to Mr. Kamlesh Jain for closing comments. Over to you, sir.
Kamlesh Jain: Yes, one second. I just finish this. Yes, so I'd like to thank everyone for being a part of this call. We hope we have answered your questions. If you need any more information, please feel free to contact us or our investor relation team , Strategic Growth Advisors. Appreciate your time.
Moderator: Thank you. On behalf of DAM Capital Advisors Limited, that concludes this conference. Thank you for joining us and you may now disconnect your lines. Thank you.

Call: May 2026

JAIN RESOURCE RECYCLING LIMITED J ArN (Formerly Known as Jain Resource Recycling Private Limited) METAL GROUP
Date: May 25, 2026
JRRL/2026-27/0011
To,
National Stock Exchange of India Limited BSE Limited

Dear Sir/Ma'am
Subject: Transcript of Earnings Call held on May 18, 2026
Ref: Regulation 30 of the SEBI (Listing Obligations and Disclosure Requirements) Regulations, 2015 ("Listing Regulations")
Dear Sir/Madam,
In furtherance to our letter dated May 13, 2026 and pursuant to Regulation 30 and other applicable provisions of the Listing Regulations, please find enclosed herewith the transcript of the Farnings Conference Call held on May 18, 2026, in respect of the Audited Financial Results of the Company for the quarter and financial year ended March 31, 2026.
The transcript can also be accessed on the Company's website at the following link:
https: jainmetalgroup.com/results-announcements.php
Kindly take the above information on record.
Yours faithfully,
For JAIN RESOURCE RECYCLING LIMITED
BIBHU KALYAN RAUTA
COMPANY SECRETARY AND COMPLIANCE OFFICER
M.NO: A31315

"Jain Resource Recycling Limited
Q4 FY '26 Earnings Conference Call"
May 18, 2026
"E&OE - The transcript is edited for factual errors. In case of discrepancy, the audio recordings uploaded on the stock exchange on 18th May 2026 will prevail"

MANAGEMENT : MR. KAMLESH JAIN – CHAIRMAN AND MANAGING DIRECTOR – JAIN RESOURCE RECYCLING LIMITED
MR. MAYANK PAREEK – JOINT MANAGING DIRECTOR – JAIN RESOURCE RECYCLING LIMITED
MR. HEMANT JAIN -- EXECUTIVE DIRECTOR AND CHIEF FINANCIAL OFFICER -- JAIN RESOURCE RECYCLING LIMITED
MR. SANCHIT JAIN -- EXECUTIVE DIRECTOR -- JAIN RESOURCE RECYCLING LIMITED

MODERATOR : MR. ABHISHEK MEHRA -- DAM CAPITAL

Moderator: Ladies and gentlemen, good day and welcome to the Jain Resource Recycling Limited Q4 and FY '26 Earnings Conference Call. As a reminder, all participant lines will be in the listen -only mode and there will be an opportunity for you to ask questions after the presentation concludes. Should you need assistance during the conference call, please signal an operator by pressing st ar then zero on your touchtone phone. I now hand the conference over to Mr. Abhishek Mehra from Dam Capital. Thank you and over to you.

Abhishek Mehra: Good evening, everyone. Welcome to Jain Resource Recycling Limited Q4 and FY '26 earnings conference call. From the management side, we have with us Mr. Kamlesh Jain, Chairman and Managing Director; Mr. Mayank Pareek, Joint Managing Director; Mr. Hemant Jain, Executive Director and CFO; Mr. Sanchit Jain, Executive Directo r. Without any more time, I would hand it over to Mr. Kamlesh Jain for his opening remarks. Thank you and over to you, sir.
Kamlesh Jain: Thank you Abhishek. And a very good evening to everyone. Welcome to Jain Resource Recycling Limited quarter four and FY '26 earning conference call. I'm Kamlesh Jain, Chairman and Managing Director of the company. Joining me today are Mr. Mayank Pareek, Jo int MD; Mr. Sanchit Jain, ED and Head of Operations; Mr. Hemant Jain, ED and CFO; along with other senior members of our team and our investor relation advisors, SGA. Thank you for taking the time to join us and for your continued interest i n Jain Resource Recycling.
FY '26 has been a landmark year for the company as we delivered our highest ever annual performance while executing multiple strategic growth initiatives across our recycling and value -added metal ecosystem. Despite geopolitical uncertainties, volatile co mmodity markets, and temporary global logistic disruption, we remain focused on disciplined execution, operational efficiency, and long -term value creation.
For FY '26, we delivered strong year -on-year growth across key financial parameters. Revenue grown by 48%, EBITDA increased by 53%, and EBITDA margin improved to 5.9%. Profit after tax grew by 56% with PAT margin expanding to 3.6%. This performance was su pported by healthy volume growth and disciplined hedging practices, improved operating leverage, and better realization across our key business segments. Our strategy continues to be built around two clear pillars , volume growth and profitability growth.
While some of our projects are focused on expanding scale and strengthening sourcing capabilities, others are aimed at improving product mix, enhancing value addition, and delivering better margins over the long term. Copper remains our largest strategic focus area. During the year, we made significant progress on our forward integration roadmap t hrough Jain Green Technologies.
Copper anode operations have already commenced, while the Copper cathode, Wire Rod, and Bus Bar projects are progressing steadily towards phase commissioning. These projects are strategically important as they move us higher up in the value chain into valu e-added products, which are expected to improve realizations, reduce earnings cyclicality, and strengthen our customer stickiness and enhance overall profitability.
In addition, our Ahmedabad joint venture project with C&Y Group marks an important step towards strengthening our copper sourcing and recycling ecosystem. This facility will significantly improve our scrap processing capabilities, support long -term volume growth in the copper business. In the lead recycling, our focus remains on maximizing value extraction from battery scrap streams and strengthening raw material security.
Following the successful scaling of tin recovery operations, we are now progressing towards antimony extraction capabilities, which we believe can become another important profitability

driver over the medium term through high -value recovery from existing recycling streams.
Internationally, our strategic investment in Kuwait continues to progress well and remains an important milestone in strengthening our presence in the Middle East recy cling ecosystem. This initiative will support supply chain integration, improve sourcing access, and further diversify our global raw material network.
From a sourcing perspective, we contin

ue to maintain one of the strongest global procurement networks in the industry, with sourcing capabilities across more than 120 countries, and domestic sourcing also improving steadily, supported by India's evolving recycling ecosystem, increased formalization, and EPR -led policy initiatives. What differentiates Jain Resource Recycling is not only scale, but also integrated multi -metal recycling ecosystem.
Our capabilities across copper, lead, aluminium , plastic, tin, and now specialty metals recovery create strong operational synergies, better byproduct utilization, and highly efficient zero -waste eco-recycling platform. Combined with disciplined hedging mechanism, a global sourcing network, and strong execution capabilities, this positions us uniquely within the non -ferrous recycling industry.
Going forward, we remain confident about long -term opportunity in the recycling sector globally. The increasing focus on sustainability, circular economic practices, decarbonization, and supply -side constraint in the mined metals continue to strengthen th e structural outlook for recycling business. India, in particular, is emerging as a high -competitive global recycling hub,

supported by favourable economics, strong processing capabilities, and growth in domestic demand for non -ferrous metal.

With multiple new vertical expected to commence operation over the coming quarters, we believe the company is entering its next phase of growth with strong integration, improved product mix, enhanced sourcing capabilities, and increasing value addition ac ross the business.

With this, I would like to hand over the call to Mr. Mayank Pareek, who will take you through the key business updates, project execution progress, and outlook. Mr. Mayank, over to you.

Mayank Pareek: Thank you, Kamlesh ji. And good evening, everyone. Let me take you through the key business updates, project execution and outlook. While our core recycling business continues to deliver volume growth supported by strong global sourcing capabilities, we ar e now entering the next phase of value creation through forward integration into higher margin copper products. Our copper value -added product project under the Jain Green Technologies unit three has now entered the commissioning phase and r epresents a major milestone in our journey towards becoming a fully integrated non -ferrous recycling and value -added metals platform.

I am pleased to share that copper anode production has already commenced in March 2026 with an initial installed capacity of 800 metric ton per month. The second furnace with an additional 800 metric ton per month capacity is currently in the advanced stag e of installation and is expected to be commissioned during quarter one financial year '27, taking the total anode capacity to 1,600 metric ton per month.

On the copper cathode side, civil construction has fully completed and the machinery erection activities are progressing well. Certain imported machinery deliveries witnessed temporary delays due to the geopolitical situation relating to Iran shipping cor ridor. However, the project execution remains on track and we expect phase one commissioning by quarter two financial year '27 and phase two commissioning by quarter three financial year '27 respectively.

Once phase two is completed, cathode capacity will scale up to 1,500 metric ton per month. The copper wire rod project is also progressing well. Civil construction is nearing completion and machinery erection is scheduled to begin in June 2026. We expect commissioning by August 2026 with an installed capacity of 600 metric ton per month. Similarly, our Copper Bus Bar and profile segment is moving ahead as planned. Civil work is substantially complete. Machinery erection is expected to commence in July 2026 and commissioning is targeted for September 2026 with a p

lanned capacity of 1,500 metric ton per month.

These projects are strategically important because they materially improve our product mix, deepen customer integration, reduce earning cyclicality, and structurally enhance EBITDA per ton over the medium term. As we had highlighted earlier, these are pro fitability -driven expansions and are expected to support margin expansion for the overall business. Moving to our Ahmedabad joint venture under Jain C&Y Circular Solution Private Limited, execution activities have accelerated meaningfully.

The factory premises have been finalized on lease and project implementation is now underway in a ramp -up model. Processing of electric motor scrap and cable scrap is expected to commence from September 2026 onwards. Installation of the planned machinery and equipment is targeted for completion by December 2026.

The project remains strategically significant for us as it strengthens our copper sourcing ecosystem and adds scale to our copper recycling operations. Once fully ramped up, the facility will significantly enhance our processing capabilities for high -quality copper scrap streams. On the international front, the Kuwait battery recycling venture continues to progress operationally. Civil construction at the site has been completed and the ordered machinery is ready at the supplier's facility. However, due to disruption in shipping routes arising from Iran -related geopolitical situation, dispatches have been temporarily delayed. The supplier remains ready for shipment with a 30 -day notice once shipping routes are normalized. Despite this delay, we remain confident about the long -term strategic importance of this project for strengthening raw material security in our lead recycling bus iness.

In our sustainability focused initiatives, we have also taken a strategic decision to establish a dedicated plastic recycling unit. Currently, both our copper and lead recycling facilities have in - house plastic recycling capacities. However, with rising p rocessing volumes and the need for better operational efficiencies, we are now creating a specialized stand -alone plastic recycling plant.

The company has finalized around six acres of land for proposed shift of plastic recycling operations from the existing copper and lead recycling plants. This dedicated plastic recycling

unit is expected to streamline operations and help decongest both the copper and lead recycling facilities.
The new unit is targeted to become operational by quarter three financial year '27 and will entail an estimated capex of around INR15 crores, which will help us further strengthen our zero waste and circular economy model. With this, I will now hand over t o our CFO, Mr. Hemant Jain, who will take you through detailed financial performance for quarter four and financial year '26 along with volume, margin, and working capital trends. Over to you, Hemant.
Hemant Jain: Thank you, Mayank sir. And good evening , everyone. I will now take you through the financial performance for the financial year ended on 31st March 2026. So, for the full year FY '26, the company has delivered strong growth across all key financial parameters. Consolidated revenue from operations stood at approximately INR9,543 crores compared to around INR6,429 crores in FY '25, representing a year-on-year growth of approximately 48%. Volume growth during this year stood at approximately 26.5%, while the remaining growth was driven by value realization.
EBITDA for FY '26 came in at approximately INR559 crores compared to INR365 crores in the corresponding period last year, translating into a growth of approximately 53%. The EBITDA margins also improved to approximately 5.9% in FY '26 as compared to 5.7% in FY '25, supported by better operating leverage,

improved product mix, and stable operational execution.
The profit after tax for FY '26 stood at approximately INR347 crores compared to INR223 crores in the FY '25, representing a year-on-year growth of around 56%, while the PAT margins improved to approximately 3.6% in FY '26 compared to 3.5% in the previous year.
Now, some highlights for the Q4 FY '26 consolidated financial performance. The consolidated revenue from the operations stood at approximately INR3,105 crores compared to around INR1,760 crores in Q4 of FY '25, representing a year-on-year growth for approximately 76%. The EBITDA margin stood at around 3.5% during Q4 FY '26. EBITDA per ton witnessed temporary compression primarily due to two external factors.
Firstly, there was a decline in sale realization formulas as a percentage of LME copper prices, which are largely an industry -wide phenomenon observed globally during the period of sharp increase in the price of the copper. As LME prices surged, customers across markets registered higher absolute pricing levels, leading to a temporary pressure on realization formulas across the value chain.
Secondly, the geopolitical disruptions arising from the Iran-Israel conflict impacted the global shipping routes and increasing logistic and fuel-related costs during March '26. This resulted in elevated liner and port discharge charges along with higher fuel costs linked to global energy prices, thereby increasing our processing cost during the quarter. However, we would like to highlight that these were largely temporary and external in nature.
Entering Q1 FY '27, shipping disruptions have eased considerably, logistics costs have started normalizing, and realization formulas are also witnessing gradual recalibration with stabilizing

LME prices. Accordingly, we remain confident that the Q4 margin compression was a transient and not structural in nature.
Coming to the business mix, from a segment contribution perspective, copper and copper alloy products has contributed approximately 55% of the total revenue, while lead and lead alloy ingots contributed 40%, and the aluminium and aluminium -related products has contributed approximately 5% of the revenue during FY '26. With respect to geographical revenue mix, 62% of the revenue was generated from exports, while 38% came from the domestic market during FY '26.
Coming to the return ratios as at March 2026, the return on equities stood at approximately 30.4%, while return on capital employed stood at approximately 25.3%. This healthy return ratios reflect our focus on capital efficiency, disciplined execution while scaling operations. We continue to remain focused on maintaining working capital efficiency despite the ongoing scale - up in operations.
Given the nature of recycling business, working capital requirements are structurally linked to raw material sourcing cycles, scrap inventory holding, export receivable timelines . And as per our historical trend, working capital days remain well under control and we continue to closely monitor inventory, receivable s, creditor cycles , to ensure comfortable liquidity while supporting future growth.
As at March 2026, inventory days stood at approximately 62 days, debtor days stood at around

18 days and the creditor days stood at approximately 14 days. Accordingly, the overall working capital cycle stood at around 66 days.
Coming to IPO proceeds utilization during the year, from the primary issue of around INR500 crores, approximately INR375 crores was utilized towards repayment of the debts, while the balance

amount was earmarked for general corporate purposes including the IPO expenses.
Out of this, approximately INR1 6.4 crores has already been utilized for IPO-related expenses.
To conclude, the company remains focused on ensuring project execution stays within planned timelines and budgets while maintaining healthy leverage metrics. Thank you. Over to you, Abhishek.
Moderator: The first question comes from the line of Naman Parmar with Niveshaay Investments . Please go ahead.
Naman Parmar : Yes. Hi sir. Thank you so much for the opportunity. So, just wanted your whole understanding on how is the whole realization usually work for you? Like you specifically mentioned about the changes in the LME has typically impacted your realization . And your scrap sourcing realization would have been increased, that's why there is an impact on the EBITDA per ton.
But if you can explain the process, how it is currently going on?
And in future there will be no such variation? Because the price of the copper and aluminium are quite very volatile in the current situation, and in future also there can be a very big movement. So how you are seeing this specifically?

Kamlesh Jain: So, Naman, the point is that here we always have hedging mechanism back -to-back work. And in the copper, there has not been a long-term contract. It's always contracts are like 30 to 60 days delivery. So, when we don't have long-term contracts, the formula in the previous years is generally varied from 0.25% to 0.5%. Maximum then on a three -month s average, it is varied only by 0.25%.
Formula don't move up and move down in the previous year, but this year copper was extraordinary rallied and the bullish trend in copper and the price went up to skyrocket from US $10,000 to $14,000. And because of that, a 40% increase in copper, the formula has impacted very big way.
So in the quarter three, we had tailwind where we have got benefited from the elevated buying and driven by exceptional demand from China. This resulted in formula -led margin compressions. – But in the quarter four, there was a structural mismatch because whatever the sales formulas gone up in quarter three is gone down little bit and because of that there was a declining in the margin.
So if you average both the quarters, it is getting normal. But because of the quarter three and quarter four there is a difference in formula pricing, and this is because of tailwind in quarter three, the quarter four margin was under the problem. There was also impact of geopolitical situation, which elevated the cost of oil, gas and chemical price compounded by war risk charges by shipping line.
And Iran conflict has laid further fuel to the cost pressure, which was not budgeted, but it has passed on in the next quarter. So there was a sudden shock from the geopolitical situation. And there is also a -- sometimes there was a -- generally the -- when the LME goes up, the sale formula drop and that was -- and then we don't hedge the formula because of the like lead we have one year or six month long-term contract.
The copper contract started, but we have changed the system now and we explained to our buyers. So in the future we will be working on a long-term hedging formula mechanism where the price of the formula which varies up and down won't affect our sale price. This is the correction we have done for the future. And we are sure that this volatility in the market when the copper like in every four-five years ' time.
One time the copper cycle boom . And because of that boom cycle the price go skyrocketing and it will impact the sale f

ormula. So after the correction, the formula get dropped also. But in the forward guidance, I'm sure that this can be maintained and with constant and steady margin from the quarter , next years. This has been one-time impact and I'm sure it will not get repeat ed because of the tailwind goes up or down. Next question please.
Naman Parmar : Okay, understood. So now your hedging purpose will be very much sorted for the long-term contracts, right? That's the right understanding.
Kamlesh Jain: Yes, yes.

Naman Parmar : Okay, understood. Secondly, on the volume side also. So if we compare from Q3 to Q4, there has been a more or less decline only in all division, copper, lead and aluminium . So it was due to the Middle East war only or it was some other factors?
Kamlesh Jain: Yes, it is because of the geopolitical war. There is a supply of the raw material has been constrained and a lot of containers got stuck in Dubai port. So we have a lot of material stuck in UAE port and we are not able to receive the material and that is why there was a problem in the raw material side so the volume has been little dropped. Which we have diverted now from the other ports, but the old material lying still stuck in the Middle East port and once the Hormuz Strait will open, then only those material come, but the future materials are getting diverted from other ports.
Naman Parmar : Okay, understood. And lastly, on the plastic recycling side, like you mentioned around INR15 crores of capex . So, it would be for specifically virgin plastics and all that you will be recycling or it's a byproduct for you?
Kamlesh Jain: No, it's always a byproduct recycling, we never do virgin product recycling. So it's always a byproduct recycling, what we are going to get from our factories. And that we will get recycle d in our dedicated facility for the plastic which we were doing inside plant earlier, but now we have bought in bulk of the sheds and it will be dedicated plastic recycling premises.
Naman Parmar : Okay, understood. Thank you so much.
Kamlesh Jain: Next question please.
Moderator: Mr. Rahul Bhangadia , your line has been unmuted. Please go ahead with your question.
Rahul Bhangadia : Thank you for giving me a chance to ask this question sir. Just a follow -up on the previous question itself. So now given that there has been a slight change or a slight pressure from the customers to kind of accept a higher rate and you see that normalizing, what is it that we should take as a normal EBITDA per ton in the copper segment? Because we have now moved from a INR55,000 number to a INR42,000 and now this quarter we are at INR14,000. So what is it that a normal number should look like?
Kamlesh Jain: So, for forward guidance, I'm sure about excluding the exceptional tailwind of quarter three FY '26 and a confluence of one-time headwinds in quarter four FY '26, the management expects normalized EBITDA to stabilize at approximately INR32,000 to INR30,000 on a steady state basis. The quarter four FY '26 result is not considered representative of the business underlying earning capacity. So, more or less I feel it will be INR32,000 per ton for forward earning s.
Rahul Bhangadia: Okay, INR32,000 per ton. And you are saying Q3 INR 42,000 that also had an element of one-time tailwind?
Kamlesh Jain: Yes, one-time tailwind.
Rahul Bhangadia: So one-time tailwind in Q3 '26 and then there was a one-time hit in Q4. So you expect the average to be INR30,000 to INR32,000 is what you are saying right now sir?

Kamlesh Jain: Yes, yes. And the value -added fo

rmula will be different. This is only for the existing business.
Whatever the value addition facility is going to come, that EBITDA will be separate from this EBITDA.
Rahul Bhangadia: Sure sir. And in general, what should we expect on the volume side? Let's say lead this year was total about 1.85 lakh tons and copper was about 54,000 tons. What should we expect there in terms of volume growth for '27 and '28? Let's say '27?
Kamlesh Jain: So we have already given the guidance earlier. And Mr. Mayank, can you just reply this question?
Mayank Pareek: Hello. Am I audible?
Rahul Bhangadia : Yes sir, you are audible.
Mayank Pareek: Could you just repeat your query please?
Rahul Bhangadia : What is the volume growth that we are expecting in lead and copper for FY27 from the 54,000 ton and 1.85 lakh tons, respectively?
Mayank Pareek: Lead and copper, as we see the trends coming in and if we don't let the international disturbances overpower the trends, a regular growth in two digits is always expected.
Rahul Bhangadia : Right sir. Okay, thank you for answering those questions sir. Thank you very much.
Moderator: Thank you. The next question comes from the line of Sumant Kumar from Motilal Oswal. Please go ahead.
Sumant Kumar : Yes. So, my question is how much percentage of raw material we are getting from State of Hormuz, number one. If the raw material is stuck there, how are we going to -- do we have a hedging policy? Do we have -- are we going to hedge that material again , if it is going to be

delayed? And how it is impact on our overall hedging cost and all?
Kamlesh Jain: Your first question is that how much material are getting from Hormuz ? We are not getting any material from Hormuz. The material is getting transshipments. So what happened that when we buy the material from the US and South American countries and some of European countries, the transshipment of the major lines like MSC and Maersk, they take at UAE Jebel Ali port, which generally they do because of the refueling of the vessel and because of the sometimes they have to transshipment the containers also.
Most of the time it's getting refueled now. Now this containers which are lying in the vessel is not able to unload and some containers got unload in the UAE port it's not able to clear. So, as we know Hormuz situation will be geopolitical and when it's get cleared we'll be getting the material. And there can be some war charges also for this holding of the material, but we will negotiate with the line and we'll get it reduced. But there are some material stuck there.
And regarding this material called hedge , we have no risk on the price movement of this material and all this material is completely hedged and there is no risk for the price movement. And I feel

that we are in constant touch with the line and lines are doing the best to I mean negotiate with the geopolitical situation. When it's get improved, we'll get our material.
Sumant Kumar : If it is going to be delayed, we have to hedge again, right?
Kamlesh Jain: No, no. Hedging is for three months and it get rollover automatically. If you don't want to square off, it get automatically rollover. Like how we do in MCX.
Sumant Kumar : How much raw material is stuck there of the total?
Kamlesh Jain: The value and the figures I can separately email to you. Total I don't have right in mind.
Sumant Kumar : Percentage of the total raw material?
Kamlesh Jain: No, percentage I can't say but it's not that great percentage of raw material. There is some quantity got stuck, but I can give you all details by separate email, how man

y containers and
what is the value of the material.
Sumant Kumar : And for copper, you are saying for the INR42 EBITDA per kg and INR32. So INR32 normal EBITDA per kg we are assuming for copper? Or higher than that?
Kamlesh Jain: Yes, if you see the average of the year, then it is coming to this extent only. Because what happen is the formula get volatile when the LME goes up and down. This year was exceptionally high for the copper volatility because 40% copper went up in four-five months and that has impacted the formula.
Generally formula does not move by 0.25% to 0.3% generally. It doesn't move much up and down. And it's been in that range. But this year because of the price movement of the LME, it impact the formula also. And in 5-year once this kind of things come where the copper move by 40% up and down.
During the COVID time, the copper had gone down by 30%-40% and again up by 30%-40%. That has been one of the volatile year after 6 years back when the COVID time was there. So -- but now we have changed the strategy also and it won't impact. And what was second question you asked?
Sumant Kumar : So the normal EBITDA per kg for copper, assuming normal case scenario ?,
Kamlesh Jain: Yes, so now we are giving a guidance of around INR32,000 to INR33,000 per ton on yearly average. Some quarter can show even 36, 37. Some quarter can show even 30, 32. So but we'll try to control the gap and it will not be highly volatile. But on average EBITDA, we assume that it will be INR32,000 to INR30,000 apart from the value -added product which is separately coming from for cathodes and wire rods and other products.
Sumant Kumar : About formula , can you disclose that what is the formula you are talking about , their volatility is more than 0.5% and it is impacting EBITDA? So can you talk on that?

Kamlesh Jain: This is little complicated for you, Sumant. If you can call me or separately email, I can send you how it works. It's a complicated business dynamics, which you need lot and time to understand this. If I spent, it will go lot of time here. Why don't we discuss it separately? But more or less, I can tell you like we buy on 80% of copper LME cables and we sell around 98% to 99% of the LME.
So we get a gap of around 19%. In that gap, sometime the gap become 16%, sometime the gap has become 23%. So the gross gap get sometime change, which we have to control it now. That's more or less for you. You want detailed, we will let's speak separately.

Sumant Kumar : So what you said the LME prices and what is the gap?
Kamlesh Jain: I said the buying price and a selling price, the difference gap sometime goes up and down because of the formula change. So anything like the value addition product, on that copper content. So let's say 1% formula change will impact INR13 EBITDA per kg. For roughly, to understand, 1% of the formula change will impact INR13 of EBITDA.
Sumant Kumar : Okay, thank you.
Moderator: Thank you. The next question comes from the line of Pratik Singh with IIFL Capital. Please go ahead.
Pratik Singh : Hi. Thanks for the opportunity. Just wanted to delve a bit deeper, just get a clarification on the volume growth. Mayank sir said, I think, double -digit volume growth. In the past, I think, we used to talk about 20% to 25% kind of a volume growth. So when you say double -digit, can we assume it's higher than 20% or between 10% to 20%?
Mayank Pareek: So lead will be in the range of 10% to 15%, but copper , because the recycling is increasing and the application is increasing and availability of scrap is increasing, therefore copper could be even

higher.
Pratik Singh : Understood. And what kind of economics can we expect from the copper value addition or copper downstream project? What kind of EBITDA margin addition or what kind of EBITDA per ton incrementally can we assume because of the copper downstream project?
Mayank Pareek: Copper downstream project has potential to further increase the EBITDA margin from 2% to 4%. The copper value -added products range from starting from anode to cathode to wire rod to the profiles. Now when we come to the profiles, they are engineering products , although the development of business might be slightly slow, but those had good margins. So overall 2% to 4%.
Pratik Singh : Understood. And is it possible to quantify ...
Mayank Pareek: I mean, on the copper that we produce here .
Pratik Singh : Okay, okay. And is it possible to quantify the impact of higher shipping, power and fuel costs in EBITDA per ton for this quarter, let's say for copper versus the sales formula change? So these two buckets, if we put the drop in EBITDA per ton, how much would it be from higher energy

prices and shipping disruptions and how much would it be from the sales formula change? Just a very ballpark percentage number also would be okay.
Mayank Pareek: Hemant, would you take up this question?
Hemant Jain: Yes. So with respect to the war situation, EBITDA per ton got impacted for around INR6,000 per ton. And with respect to the higher LME and drop in formula, it was nearing approx INR18,000 to INR18,500 per ton. So these two impacts were the large impacts, which has got EBITDA per ton for the copper coming down to this level.
Pratik Singh : Okay. And have we started to see a recovery or a fall in this INR6,000 per ton number due to the war in Q1?
Hemant Jain: Yes, that's already there in my speech . Now the shipping line disruptions have eased considerably. So this number has not become zero, but it has considerably come down and you will see that impact in the Q1 of FY27 .
Kamlesh Jain : So I'll add it here. For the future shipments, we don't have any problem. The shipments are coming now bypassing the Middle East port. And all the shipments, there is no future stuck. Whatever was stuck in the past is the problem. But now is zero problem. All the containers are coming bypassing the Middle East port.
Pratik Singh : Okay. And just one last question. Is there any option or are there any recyclers in Middle East to whom we can sell the stuck material to, or it's just not possible at all?
Kamlesh Jain: No, it is not possible because these containers are in the vessel. It is not got it unloaded. The vessels are parked in the sea, high seas. So this vessel has not been able to unload and not able to move and not able to berth also. So it is not possible.
Mayank Pareek:
Moreover , Middle East does not have enough recycling capacities too. No, these will move because this is a global problem. I mean, this is not a problem just for us, for the shipping line, for the vessel owners, for the governments, for the port authorities, for everybody this is a problem. So they will move.
Pratik Singh : Understood. Thanks and all the best.
Moderator: Thank you. The next question comes from the line of Alisha Mahawla with Trust Mutual Funds. Please go ahead.
Alisha Mahawla : Hi sir. Good evening. Sir, what is the current capacity utilization in lead and copper?
Kamlesh Jain:
Mayank, can you take this?

Mayank Pareek: Current capacity utilization on copper, what did you ask?
Alisha Mahawla : What is the cur

rent capacity utilization in copper and in lead?
Mayank Pareek: Your voice is echoing and capacity --- what did you say capacity ?
Alisha Mahawla : What is the capacity utilization in copper and in lead?
Mayank Pareek: Copper and lead?
Alisha Mahawla : Yes.
Mayank Pareek: Lead has practically peaked and right now we are working on -- so lead we have , Hemant would be having exact number, but it is somewhere on 1,85,000 tons somewhere around and it is almost around that, maybe more than 95% something like that. Is it correct Hemant? 95% something like that?
Hemant Jain: Yes. If you want, I'll give you the numbers itself. So the copper, presently we are utilizing around 65% of the total installed capacity, while lead we are almost close to 97% to 100%, and aluminum is around 35% of the installed capacity. These are the numbers for the capacity utilization for the full financial year.
Alisha Mahawla : Yes, this is helpful. For copper, can we go beyond 65%?
Mayank Pareek: Copper, of course we can go beyond 65%. We will go beyond 65% because we have additional capacities and the copper volumes will be growing, so these capacities will be utilized over next 2-3 years.
Alisha Mahawla : Okay. And what is the total capex you're looking at doing next year? Because we spoke about the cathode, anode plant and are we expanding capacity in lead? So what is the total capex you're looking at doing in '27?
Mayank Pareek: So, Hemant, you have the figures, can you can you take it up?
Hemant Jain: Yes. So we have already given in our investors' presentation. So the copper cathode first phase is already over. Now coming to antimony project, it will be to the tune of around INR20 crores. For the plastic recycling plant, which we are putting a setup will be around INR15 crores . And the Ahmedabad project is estimated to be a number of around INR30 crores. Then the Kuwait one with another INR30 crores. So, this all put together plus the phase two of the copper value - added project will be around INR115 to INR120 crores.
Alisha Mahawla : Okay. So, about INR120 crores is what we'll be doing next year?
Hemant Jain: Yes.
Alisha Mahawla : Understood. And you've been mentioning on the call that you expect that Q1 EBITDA per ton in copper to improve, but freight rates are still high and copper prices are also going higher only.

So, are we confident that the number will be better sequentially or will we see some pressure before it gets better?
Mayank Pareek
: You mean the EBITDA .
Alisha Mahawla : Yes, the EBITDA per ton in copper ?
Mayank Pareek
: Right. Yes, so you mean because the quarter four EBITDA is subdued owing to the international factors. So, you want to know whether it is going to go up.
Alisha Mahawla : Yes, because those factors are continuing as on April and May also, freight rates are higher and the copper prices are have also not softened. So, will the pressure not continue in Q1 also?
Kamlesh Jain:

So, it is not the way you think. Copper EBITDA is getting settled because as I told you earlier, there was a one quarter three , there was a huge tailwind because the people in China were expecting that the LME will go up, so they keep on buying material at higher formula. Once their LME reached to level and their appetite also got over, they had dropped the formula. So, it is because of one-time buying push from China, the formula gone up. In a stable market, this does not move up and down much. But now the LME is settled down, so the formula also got settled down. In is one of the quarters this will come like a peak movement of the LME. As an example of COVID

time and after five years this super cycle, where this formula got impacted.

This is a one-in-the-case were happened in once in five years. So, this quarter three , was like
this and quarter two was somewhat quarter two and quarter three middle, when the LME move
started, this formula got impacted.
Alisha Mahawla : Okay. Thank you.
Moderator: Thank you. The next question comes from the line of Deepak Ajmera from IGE India. Please go
ahead.
Deepak Ajmera : Sir yes, thank you for the opportunity. I wanted to ask that formula piece. What is that? How
does that work? How does it impact us? Who determines the same?
Kamlesh Jain: This I have already explained to me by earlier question to when I explained to Motilal's Sumant
, how the formula works. I have given example also that how formula works and how it is goes
up and down. And I also explained that how the management will do in the future. And if you

have more questions, definitely we can do after the call because it will again repeat on same
question.
But for your information, the formula what you ask is who decide this. This is the market
determine and not by buyer and seller. Whatever the market determines the buying formula and
selling formula, it works on that. So, like example I can give you one, we buy the raw material
in one quarter because it copper cycle is four to five months cycle.
So, when we buy the material in one quarter, the shippers ship the material after 45 days and it
take another 45 to 60 days to reach the material and 30 days for processing. And then we ship to
China another 30 days. So, it takes around five to six months to rotate the formula. So, one
quarter of formula can impact other quarter, but in two quarter average the value addition get
settled down.
So copper cycle is long compared to lead, which is a short cycle of three months. And the formula
got impacted only the once in a blue moon, which is like this time it happened when the copper
LME move aggressively in three months to 40%. Otherwise, the formula is always stable. It
does not move the market as more than 0.25%.
Formulas are not decided by buyer and seller. It's driven by market only based on demand,
supply and LME of the material. And this is not like Jain. If you see for example, any oil refining
company like example they call gross refining margin. And the Reliance Industries' example I'm
just giving. They also get impacted because of the gross refining margin, get goes up and down .
So basically that. So, any oil companies also get same thing. In commodities this is common,
which moves up and down.
Deepak Ajmera : Okay. Secondly, our three -four new projects are getting live into this financial year. How should
we expect the ramp -up?
Kamlesh J ain:
Your voice is not clear. Can you just...
Moderator: Mr. Deepak, could you please use your handset?
Deepak Ajmera : Yes. So, what I'm saying is our three -four projects are getting live this year. How should we
expect the ramp -up?
Kamlesh Jain: Yes. So as Mayank has already explained in his speech about all the projects update, where the
copper value addition project and then we have the Kuwait and then Ahmedabad and it got
delayed by two-three months might be because of the West Asia crisis.
And otherwise, all on streamline, all on time. And we hope to complete in phased manner in this
current year. So, I'm very convinced that whatever the impact was delayed, it's over now. And
now it will get over in this year. We'll be getting this.
Mayank Pareek:

So, I add here, so you are asking

about the ramp -up. So, the thing is the anode furnaces will start
within this quarter. One has started and the other will start. So, then the cathode starts, then
busbar starts and then finally the profiles start. But then as far as this project is concerned, even
if we make anode and sell and even if we make cathode and sell, we would be creating additional
volumes.
So, what I want to tell you is that we expect from the next quarter, additional volumes will come
in, whether we sell anode or we sell cathode. So, the ramp -up will be quite quick.
Deepak Ajmera : Okay. And we are coming up with antimony project. What is that? And what should we expect
from that?

Mayank Pareek:
Antimony is a critical metal present in the lead which we use in the batteries, lead acid battery. And if you are able to separate antimony from the lead, then the free antimony has better value realization. So, this project is all about separating antimony from the lead present in the lead acid battery.
Moderator: Sorry to interrupt, Mr. Deepak. I would request you to please come back in the queue for further questions. The next question comes from the line of Akhilesh Kumar from Emkay Global. Please go ahead.
Akhilesh Kumar : Yes. Thank you for the opportunity. Sir, my question is on the copper front. So, after all of this value addition, how much of the EBITDA per kg, incremental EBITDA per kg we estimate like in a normal scenario you have given the guidance of INR30 -INR32 per kg. So once all of these projects are commissioned, how much value addition do we see that to happen in per kg terms?
Mayank Pareek:
It has a potential. So, because it is a series of products starting from anode and then cathode and wire rod and finally busbar. So, depending upon to what stage we are reaching and which particular product we are actually able to sell more in the market, it will be between additional per kg at the present price rate, I mean at the present prices of copper, would be between INR25 and INR45 per kg.
Akhilesh Kumar : So, you are saying INR32 plus INR25. So somewhere INR56 -INR57 per kg will be able to do EBITDA terms.
Mayank Pareek:
Yes.
Mayank Pareek:
Yes. Or more conservatively, we can say INR22 -INR45 per kg.
Akhilesh Kumar : INR22 -INR45. Okay. Okay. So INR45 per kg is the upper limit what we can do?

Mayank Pareek:
Yes.
Akhilesh Kumar : Okay. And my second question is on the again volume growth front. So, our lead guidance has been given at 10% to 15%. In copper, how much incremental volume do we see for FY27 and then for FY28?
Mayank Pareek:
So, on the growth side, I'd given my comment on this. And I mean , volumes depend upon many things but copper growth will be a good double -digit figure. It has potential to go beyond 15%.
Akhilesh Kumar : Okay. Beyond 15%. Okay.
Moderator: Thank you, Mr. Akhilesh. I would request you to please come back in the queue for further questions. The next question comes from the line of Chirag Khasgiwala with Neo Asset Management. Please go ahead.
Chirag Khasgiwala : Yes, hi. So just wanted to understand regarding your operating cash flow. So, if you look at this quarter , this year it has gone to minus negative INR600 crores. And this looks to be mostly driven by a high increase in receivables and inventories. So, going forward, what is the path for the operating cash flow? Can it become again positive? How will the receivables be adjusted and inventories as well?
Hemant Jain: Yes. So, Chirag, you should see that within this last three -four months, we've been discussing about the increase in the copper prices a

nd the volume which has grown, you can see the overall growth of around 26% in the volume. We didn't avail any of the fresh bank borrowings within last three to four months.
So, all this requirement with respect to the working capital for stock and other things has increased because of the increase in the prices and the volume. So, whatever the internal accruals what we have earned during this period has been again deployed back for these current assets and the liabilities.
Now coming to your second question with respect to when it will become a positive . Yes, in a longer term we expect that we have already reduced the stock from comparing from Q3 to Q4 we have reduced the stock content and which will be our further policy to reduce the stock so that the working capital cycle which is around presently 66 days which should come down further below 60. So once that is achieved, hopefully we can see some positive working capital coming positive into the CFS from the Q2 onwards.
Chirag Khasgiwala : But sir, my worry is more towards the receivables. It looks like you're able to sell but you're not able to generate cash out of it?
Hemant Jain: In receivable s, the major change in this time cash flow is because of the NFRA requirement by the institute and the Companies Act. So, whatever the receivables what we have discounted with

the banks or with any of the financial institutions, they have asked us to show the separately. Previously it was like a net-off figure which we showed to which was present in the financial. So that is basically an accounting system which NFRA as per the requirements of NFRA we need to show that presently separately. Otherwise, the cash flows are healthy and you can see, the volume also has increased because of that the number of days receivable if you can see that 15 to 18 days it is well managed in the Q3 and Q4. So that is the only issue where you are seeing that the receivable part is increasing.

Chirag Khasgiwala : Okay, thanks.

Moderator: Thank you. The next question comes from the line of Aditi with Iwealth. Please go ahead.

Aditi: Hello.

Moderator:
Oh yes, Aditi. You're audible. Please go ahead.

Aditi: Yes, hi sir. Just wanted to ask about the cost structure like this quarter sequentially the other manufacturing costs have come down a lot. What could be the reason for the same?

Kamlesh Jain: Mayank, can you take this?

Mayank Pareek:
Yes, I can take this. But you have to repeat your question because you were not good audible.

Aditi: Hello. Now you can you hear me sir?

Mayank Pareek:
Yes, what was your question?

Aditi: My question was that the other cost which we had this quarter sequentially they have come down a lot. So, what would be the reason for this?

Mayank Pareek:
The other cost came down a lot in the -- okay, better Hemant you take up, other cost you mean in, in the cost in the head other cost, the cost has come down?

Aditi: Yes, the other manufacturing cost, yes. It was INR52 crores last year same March '25 and that came down to 23.88. And even if we take the December '25 quarter, it was INR70 crores. So wanted to know like why has this come down ?

Hemant Jain: Yes. So, you are referring from the other cost which schedule can you just...

Aditi: The P&L. Other expenses ?

Hemant Jain: Okay. It is presently at INR238 crores for quarter ended on -- sorry INR23 crores for the quarter ended on March '26. Okay. You mean to say last year it was 70.

Aditi: Yes. In the December quarter it was INR70 and, in the March, '25 it was INR52 crores.

So
wanted to know like why was there such a steep decline in it?

Hemant Jain:
Okay. Yes. Correct. I'm just -- open that sheet.

Mayank Pareek: Or if you want to have a look at the figure and then response maybe we take up other question and then you respond Hemant.

Hemant Jain: Yes. So, you can take up. So basically, in this there was one another change which we have made into this other expense was maintaining this fair value of hedges. So, this was in positive M2M and because of that the other expense has come down during this financial year. We can give a breaker if Aditi requires we can help her with a separate email with the breakup of this other expenses.

Aditi: Okay sir. I'll email you regarding this then. No issues.

Hemant Jain: Yes.

Aditi: Thank you sir.

Moderator: Thank you. Ladies and gentlemen, that was the last question for today. I now hand the conference call over to Kamlesh Jain for closing comments.

Kamlesh Jain: Thank you for the time and I thank everyone for joining this call.

Moderator: Thank you. On behalf of DAM Capital, that concludes this conference. Thank you for joining us and you may now disconnect your lines. Thank you.
