Call: Aug 2023

"Adani Green Energy Limited

Q1 FY 24 Earnings Conference Call "
August 01, 202 3

MANAGEMENT : MR. AMIT SINGH , CHIEF EXECUTIVE OFFICER
MR. PHUNTSOK WANGYAL , CHIEF FINANCIAL
OFFICER
MR. RAJ KUMAR JAIN, HEAD - BUSINESS
DEVELOPMENT
MR. VIRAL RAVAL , HEAD - INVESTOR RELATIONS

MODERATOR : MR. MOHIT KUMAR – ICICI SECURITIES

Moderator: Ladies and gentlemen, good day, and welcome to the Adani Green's Q1 FY '24 Earnings Conference Call hosted by ICICI Securities. As a reminder, all participant lines will be in the listen -only mode. And there will be an opportunity for you to ask questions after t he presentation concludes. Should you need assistance during the conference call, please signal an operator by pressing star then zero on your touchtone phone. Please note that this conference is being recorded.
I would now like to hand the conference over to Mr. Mohit Kumar from ICICI Securities. Thank you, and over to you, sir.
Mohit Kumar: Thank you, Carol. On behalf of ICICI Securities, I would like to welcome you all for the Q1 FY '24 Earnings Call for Adani Green Energy. Today, we have with us Mr. Amit Singh, CEO; Mr. Phuntsok Wangyal , CFO; Mr. Raj Kumar Jain , Head of Business Development; and Mr. Viral Raval, Head - Investor Relations.
I will now request the management for the opening remarks, which would be followed by Q&A. Over to you, sir.
Phuntsok Wangyal: Yes. Hi, good afternoon to all the participants. Thank you for joining the earnings call today. What I'm thinking is before talking about Adani Green and Q1 result per se, let me briefly talk about the m acroeconomic scenario and industry per se in which we are operating.
As we know, the energy transition is gaining quite a lot of traction globally. And what effectively it means is a sustainable future is now the cornerstone as well as the initiative which various present stakeholders are focusing upon. Now what it effectively leads to is there is a tremendous amount of shift towards low carbon economy, which in turn means that widespread utility scale adoption of rene wable energy growth needs to happen.
Now even in Indian context, as you would have seen, noticed in FY '23, more than 90% of power capacity addition has been through renewable energy. Even Government of India has reaffirmed commitment for 500 gigawatts of no n-fossil fuel capacity target by 2030, coupled with the fact that they had given transition milestone in terms of how incrementally every year 50 gigawatt capacity will be added upon.
Now this is the macroeconomic and industry scenario in which Adani Green is operating.
Participants, as you know, Adani Green has been at the forefront of this entire energy transition

story in India. We continue to develop large -scale renewable capacity. And as we have indicated, we plan to achieve 45 gigawatt renewable energy capacity by 2030.

Now coming back specifically to Q1 with the result per se . As o n June end 2023, we have an operational capacity of 8,316 gigawatts, which is the largest operational capacity in India.

Coupled with operational capac ity, if I add our sign ed-in capacity and the letter s of award, today, we have a locked -in portfolio in excess of 20 gigawatts which gives us a very good visibility in terms of growth, which we will achieve in near term.

As you would have noticed, our renewa ble energy capacity growth has been increasing at a CAGR of 33% over the last 5 years, which is outpacing the overall renewable capacity growth in the country per s e.

Now coming specifically to operational and financial performance. On a year -on-year bas is, our operational capacity increased by 43%. And during this period, we added 2,516 megawatts of new capacity actually. And this is basically a combination of hybrid 1,750 and then solar capacity of 212 and 5 54 megawatts of wind capacity.

During the same corresponding period, our sale of energy increased by 70% to 6,023 million units. Revenue from power supply increased by 55% to INR 2,059 crores . EBITDA purely from a power supply actually increased by 53% year -on-year to INR1,938 crores commensurate with the fact

that we have an industry -leading margin of 92.5%.

Cash profit during the same period increased by 55% to INR1,051 crores . What it effectively means is it is purely from a leverage perspective, our run -rate EBITDA now with this 8,316 megawatt capacity st ands at INR7,645 crores , with net debt of INR40,800 crores by June end to run-rate EBITDA is at 5.3x as on June '23. Now this shows how our net debt to run rate EBITDA has come down from 6.53 towards March end 2022.

From a receivable position persp ective, we remain on track. We don't have any overdue in receivable per se, actually. And coupled with the fact that our sovereign portfolio as a part of our entire capacity is at 87%, now even the non -sovereign portfolios, we are not been facing any issue in terms of stable market per se.

On second part on operational excellence, we continue to focus on operational excellence. And for us, safe, secure and sustainable operations remains a cornerstone of our entire philosophy. Now this is achieved through having O&M excellence philosophy at the site and wide s pread adoption of artificial intelligence and digitization of our Energy Network.

Our Energy Network Operation Center as we have spoken in the past, enables real-time monitoring of the por tfolio . And what it has led to is industry -leading EBITDA margin as well as consistently high plant availability. We are pleased to inform that during this quarter, we have plant availability in excess of 99% (solar) and CUF for our solar capacity at 26.9%, wind at 38.7% and hybrid CUF of 47. 2%. That is from operational excellence perspective.

Our third element is ESG. ESG remains a very important integral part of Adani Green Energy ’s operation with sust ainability at the core . Now when we talk about ESG , decarbonation of the grid remains a very important focus area, but we also need to be mindful that we should be reducing the overall carbon footprint.

From that perspe ctive, Adani Green ’s operating plant s continue to be certified as single -use plastic -free and zero waste to landfill. As you know, we are water positive for all of our operating plan of more than 200 megawatts capacity and now we want to make our remaining operating plant s wate r positive as well.

Coupled with this, we are also mindful of the fact that decarbonization at our level should not be the end to it. What is happening with the supplier s, now, from that perspective, as an additional ESG goal, which we have taken is we will be doing entire study of suppl ier level decarbonization as well . And the focus is by FY '26, we should be able to achieve decarbonization of our suppl y value chain through our GHG supplier engagement program.

That's from a dec arbonization perspective, but it is also imperative that as part of the ESG, socioeconomic development of the region is also a very important element because at the end of the day, we will be operating within those areas .

From that perspective, cr eating the local jobs, supporting the local ecosystem through critical intervention in health, education and community infrastructure remains a priority focus area from our perspective.

Last but not the least, localization of supply chain through ou r comprehensive vendor development program as part of our project management assurance group that remains a very critical focus area.

And as you would have noted, we are pleased to inform that we have largely localized procurement of trackers and continu e to look forward to such opportunities for wind turbines, solar modules as well as some of the critical supplies for our growth going forward.

Now , all these ESG efforts continue to be recognized by global institution s. During this quarter, Adani Green was rank ed the first in Asia and amongst 10 companies globally in renewable energy sector by ISS ESG in their latest rating

and ESG assessment . Plus, FTSE recently reaffirmed Adani Green as a constitu ent of FTSE4Good index and our Governance score stands at 4.5 , well abov e global utilities sector average of 3.7 and global alternative energy sector average of 4.3.

Now to conclude the opening remarks, Adani Green remains committed to produce low -cost green electrons through continued focus on operational excellence, wide ado ption of latest technology and widespread renewable energy growth.

We continue to leverage digital and artificial intelligence -based solutions to drive innovation and performance. Just to reiterate, we continue to remain focus ed on achieving renewable energy capacity of 45 gigawatt by 2030 through widespread adoption of solar , wind, solar -hybrid solution as well as energy storage solution.

So I will conclude my opening remarks here and open for Q&A session.

Moderator: Thank you very much. Ladies and gentlemen, w e will now begin the question -and-answer session. The first question is from the line of Puneet from HSBC.

Puneet: Congrats on good numbers. My first question is on your last year's solar installation cost, given that module prices w ere so high, what kind of average module price did you end up paying? And how are you -- what kind of IRR are you seeing on those?

Raj Kumar Jain: So Puneet, I think for us, one most important stuff is the relationships which we command with the suppliers does not necessarily put us on the short -term chart of whatever the module prices you see. So that's where in our projects, and that is reflected in the numbers as well, we are able to command industry -leading IRRs, which are, as we have mentioned, is at l east 2%, 2.5% higher than any competitor. So that's one.

So we were not impacted that badly or I would say, badly by the increase in the module prices. We were easily lower by at least 15% than the highs, which you saw. At the same time, we believe the recent trend in the reduction in the module prices is something which will benefit us significantly.

Puneet: So is it fair to say that at the peak, you got a 15% discount and even as it has fallen to sub $0.18, you're still getting a 15% discount?

Raj Kumar Jain: No, it doesn't work that way. That's what I was trying to say that in your supplier relationship you are not supposed to be saying that I'm market minus X. Yes, we are market minus X, but in times when the market is stressed, in terms of very h igh prices, we do get preference, which is more outsized compared to what you would have in case when the market gets favourable for the moment. So it's not a consistent number. But yes, our relationship is something which gives us something which is bette r than the market.

Puneet: Yes. So current module price discount should be lesser. Is that what you're say, because you're smoothing it out -- is it that how we should think?

Raj Kumar Jain: We will get preference than the market price, but not of th e numbers which we had earlier mentioned that we are able to take 10% to 15% discount, but not at the depressed prices of what you are seeing today. Those discounts will obviously be there but much lesser.

Puneet: And basis, your discussion, what are your thoughts on the module prices? Is there room for them to go down or you think they should be bottoming now?

Raj Kumar Jain: So I think , see, module prices ha ve multiple dynamics as you know and you have been tracking. We have seen a significant reduction ove r the last 3 months. So the entire supply chain, as we believe, in China is adjusting to this new reality. Whether it remains there further goes down or it goes up , the market forces will decide.

However, at the same time, given the current cost structures based on the discussions which we have had with suppliers, the margin for meaningful adoption in the near term seems very, very limited. I think beyond that, it will be just doing a crystal gazing and saying that, okay, which way it will go. Bec ause we have seen a lot of these forecast s going wrong badly in past.

Phuntsok Wangyal: Yes, and Puneet, just to add two more points on that math . I think what you should be also very

mindful is headline number . What sort of technology, which is being provided.
For example, even in the solar module per se, you would have noticed that a there are various technologies. So -- what effectively what is happening is with Adani Gree n bringing a preferred partner , many of these module supplie rs get the ability to adopt some of the early technology

ahead of I'm going to say market that is first thing actually. Secondly, one thing which is also important is becaus e we focus so much on developmental activities and securing land connectivity so from our execution perspective, we have got a much longer period of development of these projects compared to, let's say, like, okay, classic way of developing a project. I ju st thought of adding these two points.

Puneet: So this is very useful. My second is on your -- the numbers for first quarter for wind CUF and the hybrid portfolio CUF. So wind CUF seems to have fallen, but hybrid isn't, how should one read this?

Phuntsok Wan gyal: Yes. So I think there are two phases of it. Wind CUF, yes, you are right, it has come down on a year-on-year basis from 47% to 38.7%. And this is largely on account of two elements actually. One is okay, during this quarter per se wind speed was relatively lower compared to the last year. Secondly, okay, there was the force majeure event of Biparjoy cyclone in the state of Gujarat actually, where a large part of our wind po rtfolio is located right now.
So these two elements I can say lead to CUF of wind being lower. Now from a hybrid perspective, actually, hybrid is basically, as you know, is a combination of solar and wind. And if you look at our solar fleet per se, solar fleet has consistently been showing a higher amount of CUF number per se. So I think you should look at the hybrid portfolio from that perspective.
Raj, do you want to add anything to this.

Raj Kumar Jain: No, sure. So I t hink it is also the fact that some of the advanced technology plants have come to operations post last year first quarter. So obviously, that impact is coming here that the technology play is giving us a much better revenue on a per megawatt basis this yea r. So a lot of tracker -based plants, a lot of bifacial based plants, those are available now for the full quarter of this year. So and it's being added in the revenue, which is what you are seeing here.
That is the reason what Phuntsok was tellin g that we have been able to adopt technology much better than others and which is what is yielding results for us.

Phuntsok Wangyal: And just to put it in the perspective, our hybrid portfolio in last quarter, basically, quarter 1 FY '22 was 390 megawatts whereas right now, we have 2,140 megawatts, which also includes some of the technological element which Raj was talking about.

Puneet: Right. So basically, what you are saying is it's a new portfolio, so it benefits some higher CUF.
And second, but it didn 't get hit by the same Biparjoy impact? Why is...

Raj Kumar Jain: Yes, most -- see, as you know, hybrids are for us are more solar heavy. So it's project by project, 360 : 100, 600 : 150, 420 : 105 and in case of 700, it is 600 : 500. So this is a s plit between solar and wind. So all those are solar heavy.
So the impact of Biparjoy on solar was obviously much lesser. Second, Biparjoy impacted Gujarat much more than its impact in Rajasthan, which was more limited. So the impact was probably for a day or 2 max in Rajasthan, as it was significantly more in Gujarat in terms of extending a number of days.

Puneet: That's very clear. Just last one, if I may. Between your new plants, what kind of solar CUFs are you experiencing and the wind CUF if you can give some light, it will be very helpful.

Raj Kumar Jain: So it depends again on the plant configurations and how, where and all of those things. But I can probably give a range that we are talking about now a CUF of close to 33% to 34% for solar, what ever we are implementing based on the technologies, new technologies which we have adopted and moving ahead further.
Second, in case of wind, it is much more specific to the locations -- so the near -term development, which we are talking about, I think tho se are around the industry numbers because we are going with a higher sized turbines. So the relative CUFs would be on a per megawatt basis would be lower. But on an LCOE basis, it is going to be much better in these areas.

Puneet: So what ki nd of turbine are you talking about now? 3 plus gigawatt -- 3 plus megawatt...

Raj Kumar Jain: Sorry?

Puneet: 3 megawatt plus turbines is all that you're adopting now?

Raj Kumar Jain: This year onwards for the site in development, which is in Khavda. So we have one site which is finishing its development, which is 1 and 2 -- 2.2 megawatt turbines, which is finishing its development very soon.

For the second site and the site next year, we are focusing on high wind regions, and that's where we are dep loying 5 -plus megawatt turbine, and that's where you will see these new turbines made for those sites being used and giving us on yearly basis much better performance.

Puneet: I have some more, but I'll come back in the queue.

Moderator: The next question is from the line of Nikhil from Bernstein.

Nikhil : I think my first question is in continuation to the previous one. If you could just give us some specifics on wind PLFs. Going forward, what should we consider given this continued to disappoint e veryone, I mean, the industry, in general, so what would be like a 90 PLF we could assume for existing and future assets for wind?

Raj Kumar Jain: So I think, as I said, this is site to site, specifically giving one number becomes difficult for me to respo nd, but I think I can ask Viral to engage with you on that. With respect to going forward, for the large site, which we are developing now in Khavda. There, we expect the CUFs to be in the range of 38%, 39% per se.

And I think the numbers would be a bit mo re realistic there just because it's an unhindered site with nothing in front of it. And directly facing more or less the sea and the wake effects are significantly lower, and we have the track record of last 6 years -- close to 6 years now in terms of mi ning the data there. So we are pretty confident on that particular site.

But at the same time, I agree for most of other locations, which are impacted by some of the reasons which I've mentioned, which is more new turbines, the changes in the contours, cha nges in the weather patterns, those are more impacted and we have seen underperformance.

Amit Singh : Let me add. This is Amit. Just to kind of give another -- a bit of color on this. I think while we are looking at PLF, I mean, the performance of a wind is a nonlinear function. So it's very important that we maximize the performance of wind turbines. And to be able to do that, we are doing a very deep investigation using our digital and AI tools to essentially focus on two areas. Area number one is to detect problems before they happen, to have a proactive approach of solving any issues which might arise. And this will ensure that we are improving our performance when winds are blowing well, but also there are other variables like pitch and multiple other vari ables, which have to be factored in to ensure optimum generation of electricity and reduce L

COE.

So that is one big area of focus. The second area of focus is essentially to have a very performance led focus area in our O&M where we are focus ing on improving the performance per se of the wind turbine and PLF is one function of it.

But I think we should look at the overall generation and LCOE reduction essentially. So those are the two kind of mindset we are following, and we believe that will drive better results for us, both in Khavda and beyond.

Nikhil : Got it. One related question is in terms of sourcing. So there have been some developments in Europe, which we understand doesn't impact India per se because that's even higher rated turbines. So what would be the sourcing strategy, both on the wind and solar side? If you could share some color on solar to how much Chinese versus domestic mix and on wind plans for future exposure to Siemens Gamesa or to domestic players?

Amit Singh : Yes. I think I'll just maybe give a bit of a color and invite Raj as well to add. I think when it comes to wind, I think it's important we customize our wind turbines to the geographies we're operating in because it's -- and I think we have also realized th at having right inventories for bearings, turbines and other equipment is important so that you are able to bring the plant up and running quickly.

So as we have stated earlier in the opening remarks as well, our medium - to long -term strategy is to lo calize our supply chain, and we will continue to do that. And we will take advantage of any price gaps or any movements to take advantage in repowering or in new projects. But our overall strategy is to localize. And I think the European problem as we are very well aware we obviously use some of those suppliers, but the turbines we use here are different and the problems are also different. And we are working with all of them proactively to make sure that we are not as impacted as I think our European frie nds are. Raj go ahead.

Raj Kumar Jain: Yes, sure. So thanks, Amit. Just taking this forward for wind and solar, as you mentioned, specifically, separate. One wind going forward and for -- we offered the site of Khavda to multiple vendor s and saw which turbines can actually be best suited for this particular thing.

And the good part is the group as its own strategy on supply chain could develop a turbine for this particular Khavda site, which is what we intend to use in this area given the fact that our analysis shows that those turbines are our best in terms of generation and LCOE for this particular area. It's one of the very good wind sites in terms of wind speed. And effective wind speed, I would rather say, and which is where I think the natural strategy there is to buy this locally made turbine, which is customized.

So that's the most important thing, which I want to highlight, customized for this particular site. Now coming to the remaining supply chain -- when it comes to, say, solar. So we hav e been working with respect to developing the local ecosystem.

Again, within the same strategy, the group has a manufacturing capacity for multiple components now. There are module trackers, which are there. Within the mod ule ecosystem also, we have multipl e options, say, a lot of power project s have all of these taxes as a pass - through. So obviously, that opens up significant sourcing opportunity from low -cost areas in China and elsewhere.

There are places where we can optimize between domestic supply as well as supplies from overseas. So all of this is something which will -- which is part of our sourcing strategy. And as Amit mentioned, as we move along, some of this will move to local supply chains, and we are actively engaged in getting those developed.

Nikhil: Understood. Just to understand then on modules, then -- I mean the dependence would continue to be on China, at least in the ALMM

comes in. Am I fair to assume that?

Raj Kumar Jain: I'm not necessarily impacted too much by the ALMM in my contracted p ortfolio. My contracted portfolio is -- you can say, it does not fall into the guideline of ALMM right now. As we contract more, it may. so that's where I'm in an advantageous position. I can easily source from the cost - competitive countries.

But I think t he more factor for me is whether the BCDs are passed through or not. The good thing is in almost all of my portfolio, except in a few cases, I have this particular duty as a pass - through as a change in law. So that is where I'm optimizing my project cost a nd I'm optimizing the LCOE. But it is well understood and that is a clear -cut focus from the management that we need to develop the supply chain in a manner which can support our future growth while we are sourcing the modules for our future projects.

Phun tsok Wangyal: Nikhil, just to add, if you recollect in the last earning call, we specifically guided that as far as this financial year is concerned, the capacity which we are building up doesn't fall under the ALMM as well as BCD pass -through. So all the modu les will be procured from overseas actually. And as far as our wind projects in this financial year is concerned, that is in the Khavda region actually where Raj was talking about, we have a customized WTG. So that will be locally sourced upon.

Nikhil : Perfect. Perfect. That's very clear. Just maybe then 2 last questions. One is if there was any infirm power sale this quarter as well, which was a big support last time? And second, on funding, if you could share any updates on equity or debt side?

Phuntsok W angyal: Yes. So infirm power during this quarter has not been that significant, actually. And if you recollect the same discussion which happened during our last quarter on the earnings call, also. In this quarter, actually infirm power is approximately ar ound INR20 crores from the specific project .

But what we do expect is okay, where our capacity addition is planned for this financial year , infirm power will be progressively especially from Q3 onwa rds will continue to play a more significant role. But for Q1, it is only INR20 crores . And for Q2 also, we're not expecting that much meaningful -- that much significant contribution from infirm power.

And from a financing perspective, actual ly, for this financial year, as we guided, we are targeting 2.8 to 3 gigawatts and out of which actually may be for 300 megawatts of financial closure already will be achieved.

Balance will be 150 -megawatt already will be achieved for 330 -megawatt solar, w hich is under construction. That also with the financial closure achieved. For wind 260 -megawatt, we have received the term sheet. Now that is under finalization. And for balance capacity, that will be tied up as a part of our construction facilit y where bank group diligence is already completed actually. Bank group is already identified.

And in the next 1, 1.5 months, we should be completing our financial closure for that.

Nikhil : Understood. Understood. Any updates on the equity side, there wa s the discussion of QIP or some -- anything on that or not at this point?

Phuntsok Wangyal: Yes. Not at this point. What we can say is, okay, the Board has recommended up to USD 1.5 billion QIP, which is currently under regulatory approval process. And sub ject to shareholder approval, as you know, we will be having 1 year to finalize the contours of QIP.
Moderator: The next question is from the line of Puneet from HSBC.
Puneet: Thanks for the follow -up. My first question is how should one think about you in the bidding trajectory? I don't see too much of your name in the current tenders. What is the strategy there? And secondly, what is the progress on the manufacturing in tender?
Raj Kumar Jain: So Puneet, thi

s is the advantage of being lo cked in fully and acting in time to tie up the capacity.
So as I've mentioned in last call also for my execution over the course of next 2 years, whatever we have planned, we have the PPAs in hand, the projects in hand.
So logically, I'm not in any hurry whatsoever to tie up additional capacities because generally, you get 24 months roughly for execution. So I already have projects. However, we continue to look at the market for opportunities, which can provide us real delta. So if there are delta opportunities or alpha opportunities, you may see us participating, not for plain vanilla solar and wind tender right now because we have our plate full for that right now, for the next 2 years.
Amit Singh : Yes. I think our focus really is on execution. And as you may recognize, to deliver 45 -gigawatt by 2030, we need to really ramp up our operating capacity. And me and my entire management

team is focused on delivering the PPAs we have signed and maximizing the performance of those PPAs to make sure that we deliver abo ve average returns.
And from existing installed base, we look to optimize and improve our performance as well.
There's no reason for us to essentially go out and tender right now until there is an opportunity like Raj talked about, which is attractive and high-grade portfolio.
Puneet: But how should one think about the capacity constraint? You're still installing 3 -gigawatt out of potential industry doing 15. So is there a capacity constraint you're talking about in terms of execution? Is it more management bandwidth capacity constraint or just the vendor -related capacity.
Amit Singh : I think there are two dimensions to this, which may be are the ones which are in our radar. The first dimension is developing an ecosystem of suppliers and contractors. We a re now starting to touch the upper limit on capacity of the ecosystem.
So it's very important that we proactively work with developing suppliers and vendors. So we have rolled out a very comprehensive vendor development program for our key suppliers. And we are strategically sharing our designs and plans with them to make sure that we develop them and we get them to be ready at a lower cost of operations to kind of match with our time lines.
And the second one is essentially manpower and hum an resources on the ground, which is also very important to recognize that the country is growing and manpower needs to be trained.
We have very important and right focus on safety on making sure that we bring these people and get them up and running and t rained. So we are, again, proactively launching that and making sure that we focus on that over the next few years, to ramp up that capacity and also tie them into our agreements. So those are the two kind of dimensions we are focusing on amongst many others . And we feel that will be kind of what will be an area of focus for us in the near future.
Puneet: And in terms of physical, when are you expected to launch our own modules and your own wind turbine, what is the time line for the commissioning of those pr ojects?
Raj Kumar Jain: Yes, sure. So from the perspective of these equipment’s , I think I just want to clarify that it is part of Adani Enterprises. The group is developing its manufacturing facilities as part of that venture. Within that, as we understan d 4 gigawatts of module manufacturing capacity of Mono PERC as well as the TOPCon module which are already up and running.
And they are backward integrating that further down to in got and wafer in stag es and then probably pol ysilicon , etcetera. But they also hav e significant tie -ups for ancillaries in terms of co-invest ing in glass, module, frame, etc etera, and other ancillaries to ensure that the cost for them is competitive. That's one. The wind turbine manufacturing is already up and running. As

we speak, they are awaiting the last clearance from MNRE to be able to commercially launch the wind turbine, and that can come any time. So they are fully ready to now start producing this particular turbine.
Puneet: What is the capacity there?

Amit Singh : I think it's worth maybe join the AEL call and maybe have...
Raj Kumar Jain: Yes, I think that will be better.
Puneet: Understood. And the status on your manufacturing unit tender, have the final PPA signed now...
Raj Kumar Jain: So I think out of the 8 -gigawatt, we ar e close to 6,200 megawatts already signed. 1,799 -megawatt is to be signed, out of which we are in very, very advanced discussion with SECI where we believe over the course of next 1, 1.5 months, a significant part of this will be closed.
Puneet: Understood. And lastly, if you can give some guidance on your thoughts on the capex to EBITDA, what kind of numbers are you targeting now?
Raj Kumar Jain: Pardon me?
Puneet: Your capex EBITDA, what kind of gross block to EBITDA would you be targeting?
Phun tsok Wangyal: Yes, sure. So as we have -- I think our run rate EBITDA for this -- for corresponding to these 8,316 megawatts , we are talking about run rate EBITDA of around INR7,645 crores actually.
And adding to 2.8 to 3 gigawatts of incremental capacity, which we will be adding in this financial year, we are talking about approximately INR10,800 crores of run rate EBITDA.
Puneet: And the gross block for this?
Raj Kumar Jain: So in terms of -- for incremental capacity you're talking about?
Puneet: Yes, for increment.
Phuntsok Wangyal: Yes. So I think what we are -- capex cost per megawatt, which we have broadly talking about, excluding BCD for solar projects is between INR4.8 crores to INR5 crores actually. So that is what will be added for wind.
Raj Kumar Jain: It will be close to INR6.3 crores to INR6.5 crores per megawatt. And so this, again, is industry leading in terms of the cost of power, putting up turbines.
Moderator: The next questio n is from the line of Nikhil Abhyankar from ICICI Securities.
Nikhil Abhyankar : Sir, you have mentioned earlier that you are looking to focus on execution in the coming years. So when should we expect you to participate back again in new projects build our 45 gigawatt capacity?
Raj Kumar Jain: Yes, sure. So I think just to be very clear, as you understand the industry, the moment I take up on capacity today, I need to ensure that I'm implementing that within the next 2 years, okay?
And what I mentioned as r esponse to my earlier question in my -- in the earlier question was that the lock ed-in for 2 years. So you would see us probably doing more locking capacities in the next 6 to 8 months as some of this capacity I start tying up for period beyond 2025.

And the re, again, just to re -highlight what we mentioned last time in our call is I already have significant flexibility to be able to prepone some of the capacities which fall after that period out of my existing portfolio.
I'm under no pressure to really get into the competitive bidding right now. And that's where the focus would be that -- if I -- instead of going into competitive bidding, I do other things which basically ensures that I'm able to get the delta .
And you will see us moving through that over the course of 6 to 8 months in terms of being able to highlight some of those things as we move.
Nikhil Abhyankar : Understood. And sir, now there's a lot of buzz around the C&I segment shifting towards renewable. So how is the dema nd and how are the inquiries going on over there?
Raj Kumar Jain: So yes, you're right in terms of the decarbonization drive, which everyone in the world is now committing to for all the reasons, which you know with respect to whether they have their ow

n
commitments, whether the countries have their own commitments, whether the exporters need to satisfy the requirements of their clients. So decarbonization has become a very big theme and the opportunities around that is expanding very rapidly in the market.
Added to that, for us, within the group also, there are additional opportunities for which we get inquiries. So that is one thrust area for us where you will see some of the capacities being added to our portfolio. And I think as we do that, obviously, we will be able to tell you.
But just coming back to the point that from the overall perspective, having wind solar along with hybrid sites, along with PSPs, along with capacity around other storage, the level of opportunity, which AG EL has and the way it can serve the client is -- it puts AG EL in a unique situation to serve this. So I think from an opportunity perspective, this is big for us, and we are fully focused on it, and you will see some of that.
From our side, the market is picking up. There are multi ple models which are going in this particular thing because everyone has their own needs. We are fully into it. And I think you will see more of that being discussed in a few of our next calls.
Nikhil Abhyankar : Understood. Sir, you also mentioned about th e 5.1 -megawatt wind turbine that the group companies developed. So what kind of -- what size of projects are we looking to execute with

these turbines? And are these turbines cheaper on a per megawatt basis or the project as a whole is cheaper? Basically, it saves us the BOS costs. So if you can just briefly touch up on that.

Raj Kumar Jain: Yes, so it's a 5.2 megawatt turbine, just to be correct on the number rating. And as I have indicated in my earlier comment, the cost, as you know, is significant ly lower on a per megawatt basis than the alternatives available. However, large r the turbine, the per megawatt generation, which basically also goes down, and we are aware of that.

And that is where we look at all these from an LCOE perspec tive and the LCOE for these wind turbines because of those being more suitable for the sites, which we have chosen gives it a significant advantage for us. So I think these are wonderful turbines when we are looking to

deploy them in Khavda and because the se turbines, whether it is size, whether it is the performance power curves, whether it is thrust curves, all of that has been optimized having 5 to 6 years of Khavda wind data.

And that is where we believe that these turbines will give us a significant op portunity there. In terms of turbines at other locations, while in a few of the other locations, just because these turbines are pretty competitive, they may get used. At the same time, we also understand that at other locations, we would be looking for al ternative supply chains.

And accordingly, the decisions would be taken. But I think it's a bit ahead for me to comment right now which other turbine I will be using at other locations, which is not in my execution plant right now.

Moderator: The next quest ion is from the line of Rabindra Nath Nayak from Sunidhi Securities.

Rabindra Nath Nayak: Two questions. So you have mentioned that group is actually developing its wind turbines recently and also they are ready for this commercial aviation. So what cost advantage per megawatt basis do you see in the wind turbine procurement from the group and that from the other non -group manufacture. That is one. And you mentioned that the group is also looking for decarbonization need. So what is the capacity win, and this is from our side for the group need in the next 2 to 3 years, some of the group companies need to make the decarbonation need. So that is 2 questions.

Raj Kumar Jain: Yes, sure. On the first question, with respect to the advantage on a per megawat t basis, I think I've mentioned tha

t the cost on an all -in basis including the turbine , BOS, IDC, land, evacuation, everything put together, is depending on that location is anywhere between INR6.3 crores to INR6.5 crores per megawatt.

Now you have to compare it with different turbine manufacturers and there are enough data available on that in the market, I don't want to really comment. But the broad range with ranges which we have seen is anywher e between INR7.25 crores to INR8 crores kind of a cost in the market o n a per megawatt basis.

But again, per megawatt is not the right way to compare turbines. You have to see the LCOEs. And you have to see the locations whe re those LCOEs are being calculated and that's where I would say that the turbines are one of the best ones for us in Khavda, which is our focus for development for wind in the next couple of years.

Rabindra Nath Nayak: The structure of this turbine is 2 m egawatts or 5 megawatts, sir?

Raj Kumar Jain: This particular turbine is a tubula r turbine with a hub height or 120 -meter. They have the capability of doing 140. This 120 -meter turbine with a 5.2 megawatts weighted capacity has RD of 160 meter, okay?

So th is is what is going on our deployment in Khavda, however in current project which we are doing right now there, which is what we are finishing very soon, do use 2.1. So I just want to

ensure that I clearly specified that my current project is finishing wit h 2.1, but my new project, which I'm implementing in Khavda is going for 5.2.

Rabindra Nath Nayak: Okay. Okay. So the group need -- decarbonization need, if you can highlight something?

Raj Kumar Jain: So I think it's wrong for me to probably speak on beha lf of the group per se, but at the same time, enough has been said around that. The targets are set for 2030, 2025 in different group companies. I can only say this infrastructure will develop in terms of providing the opportunities.

And I think enough is a vailable for us on the plate to be able to cater to them on these capacities. You will see some of those as it crystallizes in terms of the projects, some of those being mentioned, but we are not necessarily in need of PPA tie -ups for being concerned abou t whether this comes, when this comes and all that. So it's a good opportunity for us, which is available

coming from the group. So we will use our expertise.
Moderator: The next question is from the line of Puneet from HSBC.
Puneet: Yes. Sorry thanks. My question has been answered.
Moderator: Thank you. Ladies and gentlemen, that was the last question for today. I would now like to hand the conference back to the management for closing comments.
Mohit Kumar: Yes. Thank you. I think it's great to have -- I see a question maybe somebody is asking from Dhruv group.
Moderator: So one question just came up. It's from the line of Dhruv Muchhal from HDFC Mutual Fund.
Mr. Dhruv Muchhal, your line is unmuted. You may go ahead with your questions.
Dhruv Muchhal : Sir, the question was related to the wind. You seem to have an advantage because of the -- because of your specific designed wind turbine and the location. I also wanted to understand, I think, the Khavda location, I think seems the turbine working with Khavda location best, but wasn't the Khavda location specifically for the hydrogen plants for the group? Or if not, then what is the potential of wind capacities that you can put up in this location? I mean, I was just trying to understand wha t is the scope which is available, which is very easy to grab?
Raj Kumar Jain: So Dhruv, I think while that is a potential use case, but at the same time, as we understand from the group, group is in a very, very advanced stage in locking in a very large l ocation, much bigger than Khavda part what we have for their hydrogen requirements. So that's where there is -- this particular entire pat ch is

something which we are developing is being fully utilized by us for the AG EL projects. We are not envisaging any h ydrogen related to this there.
And this is something which further de -risks us significantly in terms of our execution. As you can understand that out of the 45, close to 15 gig land is single location. So that basically, de - risks us significant ly. So I think that's what it is. And the wind potential is something which is easily north of 2 gigawatt, more wind we are currently tying up.
Dhruv Muchhal : So you mentioned 2 gigawatts?

Raj Kumar Jain: Yes, north of 2 gigawatt. But I think it's something -- Dhruv, it's not necessarily frozen and that's where we would not necessarily say this is the final number. We are developing on it.
Dhruv Muchhal : It will evolve. Got it. And sir, you also mention ed with the C&I, you are also planning for pumped hydro. There were some discussions earlier about pumped hydro. You have, I think, got a few contracts MEP, but I'm not sure of the incremental developments. Are you executing a few projects, probably the si ze and scale, if you can highlight something What stage are we in?
Amit Singh : Yes. Let me maybe just quickly answer and then I can wrap up as well. So I think on the pump ed hydro, I think we are in advanced stage of engineering design and project study we a re expecting to approve FID in the due course. And we should be able to kind of share with you an update in the later part of the year on our initial project engagement and execution plans.
But it's fair to say that pump ed storage will be a key part of our s trategy. It is a key part of our strategy, and it will be a significant part of our portfolio in the next few years as we grow towards 45 gigawatt. And I think this kind of questions you already asked. A lot of our C&I customers are asking for round -the-clock renewables or as much as possible renewables. So we will make sure that our approach is designed to service those kind of requests and maximize returns for the investments we're making in our projects today.
And these large land parcels we have access to. Remember, we have also installed in advance, 2 years, 3 years of wind mast and resource assessment, which is allowing us to maximize performance of the wind turbines and which has gone as a key input to our suppliers in designing whether turbines or a ll the balance of systems. And we are very confident that this approach is going to deliver lower cost of energy, electricity and maximize our performance as AG EL.
So thank you. I think we've run out of time. Yes, I can quickly wrap up. I think I reiterate what we said in the opening remarks, we are really razor bent on our target of delivering in excess of 45 gigawatt by 2030 through the use of solar . wind and solar -wind hybrid solutions as major contributors.
I also want to really thank my tea m and their dedication for delivering such outstanding performance and more to be continued. Thank you very much for joining us today. Back to you.
Moderator: Thank you. On behalf of ICICI Securities, we conclude today's conference. Thank you all for joining. You may now disconnect your lines.

Call: Jan 2024

“Adani Green Energy Limited

9M FY24 Earnings Conference Call ”
January 30, 202 4

MANAGEMENT : MR. AMIT SINGH , CHIEF EXECUTIVE OFFICER
MR. PHUNTSOK WANGYAL , CHIEF FINANCIAL
OFFICER
MR. RAJ KUMAR JAIN, HEAD - BUSINESS
DEVELOPMENT
MR. VIRAL RAVAL , HEAD - INVESTOR RELATIONS

MODERATOR : MR. MOHIT KUMAR – ICICI SECURITIES LIMITED
Moderator: Ladies and gentlemen, good day and welcome to Adani Green Q3 FY24 Earning s Conference Call hosted by ICICI Securities. As a reminder, all participant lines will be in the listen -only mode and there will be an opportunity for you to ask questions after the presentation concludes. Should you need assistance during the conference c all, please signal an operator by pressing star, then zero on your touch -tone phone. Please note that thi s conference is being recorded.

I now hand the conference over to Mr. Mohit Kumar from ICICI Securities. Thank you and over to you, sir.
Mohit Kumar : Thank you, Riya. Good afternoon. On behalf of ICICI Securities, we welcome you all to the Q3 FY24 Earnings Call for Adani Green Energy. Today, we have with us from the management, Mr. Amit Singh, CEO, Phuntsok Wangya l, CFO, Raj Kumar Jain, Head of Business Development, and Viral Ra val, Head of IR. Over to you, Viral. Thank you.
Viral Raval: Thank you, Mohit. Good afternoon and thank you all for joining the earnings call today once again. We have uploaded our earnings presentation on our website and we hope that you would have had the chance to go through the same.
In terms of the flow of this call, we will first have brief opening remarks by our CEO, Mr. Amit Singh, on the key operational updates, followed by a brief update by our CFO, Mr. Phuntsok Wangya l, on the financial performance and other key financial milestones. This will be followed by Q&A. So, over to you, Amit. Thank you.
Amit Singh: Thank you, Viral, and thank you, friends, for joining this call in the new year. In 2023, the global annual renewable capacity addition has increased by almost 50%, the fastest growth in the past two decades, and we expect this momentum to continue through the end of the decade, which is very closely aligned with the pledge taken by several countries at COP28 of tripling renewable energy capacity by 2030. India is a rapidly growing economy and renewables will play a very crucial role in its growing energy demands.
Our country has taken several policy steps to advance towards the 500-gigawatt non-fossil fuel capacity target by 2030. The key ones include strengthening the supply chain, building the transmission network, the storage solutions, and mobilizing the capital resources to meet the significant capital outlay needed to convert this visi on into a reality. At Adani Green, we remain focused on our 2030 target of 45 gigawatt and continue to focus on tightly controlling key resources, including capital, supply chain, and people planning, which we believe are the key pillars for successful execution.
During the last quarter, with equity and debt capital raise, we have put in place the capital

management framework for a very well -secured growth path to the target 45-gigawatt capacity by 2030. We continue to ramp up our execution capability and capacity by focusing on a very resilient supply chain, which is diversified, and a very strong emphasis on localization. Digitalization at scale, workforce expansion, and competency bui lding as well.
As we work on the world's largest renewable power plant at Kha vda in Gujarat, we will create a blueprint for mega -scale RE projects across the world. As an important milestone on the overall renewable portfolio front, we have recently completed PPA tie -up for the entire 8-gigawatt manufacturing linked solar tender issued by SECI, with the remaining 1.7 gigawatt recently tied up. With this, AG EL now has a total portfolio of 19.8-gigawatt capacity backed by signed PPAs. The total lo cked-in growth portfolio stands at 20.8 gigawatt, further including merchant portfolio of 1.01 gigawatt. Along with the robust business growth, we have continued to progress on our sustainability commitments as well.

As a testament of our continued focus on strengthening our ESG commitments across the organization, we have been ranked number one in Asia and among the top three globally in RE sector as per the latest ISS ESG ranking. Further, AG EL has been ranked first in power sector in the latest CRISIL ESG assessment with improved score for second consecutive year.
• Coming to operational performance for nine months ending December 2023, we have continued to have robust performa

nce on year -on-year basis. Our operational capacity has grown at 16 % to 8.4 gigawatt, with greenfield addition of 700-megawatt solar wind hybrid, 300-megawatt wind, and 150 megawatt solar projects.
• Our solar portfolio C UF has remained stable at 24 %, and wind portfolio C UF has seen an increase of 510 basis points to 32.2 %. And solar -wind hybrid portfolio has increased by 750 basis points to 41.5 %.
• Backed by the robust capacitation addition and improved C UF, the sale of energy has increased by 59 % to 16,293 million units.
Let me now hand over to Phu ntsok to provide you updates on our financial performance and some of the key financial milestones.
Phuntsok Wangyal: Yes, thank you. Thank you, Amit. And thank you, all the friends, for joining the call. Amit has talked about excellent operational performance. Let me briefly update all of our friends on financial performance for nine -month period ending December 2023.
• Backed by strong operational performance, the revenue from power supply has increased by 57 % to INR5,794 crores . Just as a point of reference, INR5,794 crores . excludes the treasury income which we have received during this nine -month period, which translates to INR961 crores .
• EBITDA from power supply increased by 52 % to INR5,412 crores , and we continue to maintain our industry -leading EBITDA margin of 92 %.
• Cash profit during the same corresponding nine -month period increased by 61 % to INR2,944 crores .
• The run rate EBITDA for the operational capacity which we have right now, which is 8,478 megawatt, which Amit talked about, stands at strong INR7,806 crores . And this is leading to significant improvement in my net debt to run -rate EBITDA at 4.98 x compared to 5.6 x last year. The run rate EBITDA of INR7,806 crores excludes the EBITDA contribution from capacity which are charged but not yet commissioned. We expect that those capacities will have EBITDA translating to nearly INR254 crores .
Now, let me take you through some of the other important recent financial milestones, which actually is in line with our capital management philosophy as well as the growth aspiration which Amit talked about.
• Post the recent shareholder approval, we have issued equity share warrants to the promoter s for a total investment of INR9,350 crores , out of which we have already

received INR2,338 crores , and remaining amount we expect to receive in 18 months.
As you all know, as a part of our disclosure, we have clearly stated that the equity warrant issuance, the utilization will be through a combination of payout to holdco bond as well as funding my capital growth in line with my expectation to reach 45 gigawatts by 2030.

• During the same quarter, we completed our newly formed JVA with total for 1,050-megawatt portfolio. And in the process, we have raised INR2,497 crores , which we have already received.
• During the quarter, we upscaled our debt funding pool under construction financing framework from USD 1.6 billion to USD 3 billion. So, as a part of my upscaling, we have raised USD 1.36 billion USD and we have already started drawing under the facility. This is apart from other financing which we have raised under our ongoing capital raise program.
• We have recently made announcement that in line with our guidance, we have now completely put in place cash backed funding for 750 million Holdco bond redemption , which is due in September 2024.
• During the same quarter, in line with our capital management philosophy, we have also refinanced some of our operational assets at very competitive rate, near to 8.5%. And this corresponds to some of our portfolio which have achieved operational performance and broadly, the refinance amount is nearly to USD 400 million. Now, this continuously emphasizes our focus on bringing our cost of capital down.
With t

he above milestone, we would like to advise our investors that they will remain focused on playing a crucial role in energy transition in India with a growth trajectory fully supported by disciplined capital management and highest governance standard s. And we are fully committed and in line to achieve our 45 gigawatts by 2030. Thank you and I would request the operator to open the line for Q&A.
Moderator: Thank you very much. We will now begin the question -and-answer session. First question is from the line of Nirav Shah from GeeCee Holding. Please go ahead.
Nirav Shah: Good afternoon, sir. And congratulations on a very good set of numbers as well as completing the total GV during the quarter. So, congrats on that, sir. Just a few questions. The first question is our locked -in portfolio has increased by 410 megawatts fro m what we declared in the last quarter to this quarter. And it has been entirely on merchant, which is now on approximately 5% of our total portfolio.
So, on a target of 45 gigawatts, where do we see the merchant portfolio contributing? How much do we see that? And the related question is, what is the group capital potential over the next five years where we can capitalize?
Amit Singh: Yes, so I think let me maybe try and give you a bit of a color on that. Listen, I think the merchant portfolio for us kind of goes up and down based on, you know, how we see the mismatch in price and, you know, the future projections. Today, I think it's 5%.

And I think we feel that you will have a bigger capacity, you know, in lower te ens by end of this decade. Now, I think it's very hard to give an exact number. We will make a call on those as we go, depending on how the market evolves. But we are quite bullish on how the market is evolving, the price sentiment. And we are making some investments to grow our merchant portfolio going forward.
Nirav Shah: So, it's low te ens as of now, as we speak. I mean, it can change, but that is what our envisage is?
Amit Singh: Yes, I think we will keep a balanced portfolio as well. And we want to make sure that, because there's a significant C&I customer base, which we are also tapping in. We want to make sure that we have a balanced portfolio.
We have a lot of projects which we have already, you know, signed up. So, we need to execute that over the next two years. Having said that, I think we are carefully watching this space. And you will see us, you know, in the following quarters making some positive updates on that side.
Nirav Shah: Got it. And on the group cap tive potential, sir?
Amit Singh: Group captive potential also is evolving. I think it's north of 2 gigawatts over the next few years. And I think it's a number which we are also implementing in parallel. And this is outside the 45-gigawatt number which we have stated. So, just to be clear on that.
Nirav Shah: It's 2 gigawatts , you've said?
Amit Singh: North of that. And remember, I think that, again, is evolving as the capacity demand for the group companies evolve. And so, that number will also change. But, yes, that's a fair assumption you can make over the next few years.
Nirav Shah: Got it sir. And, sir, if I can ask, on the Total JV deal, what is the tax implication on that?
Amit Singh: I'm going to pass on to Phuntsok maybe to give feedback on that.
Phuntsok Wangyal: No, I think there will not be any tax implication, actually, on that.
Nirav Shah: Okay. And what's the accounting treatment like, sir? I mean, now that it is, even the previous INR4,000 crores has been converted to CCD?
Phuntsok Wangyal: Yes, I think there are two elements in it. As you know, our previous arrangement was we had

the staple instrument from Total, actually. Those staple d instruments have been completely converted into compulsory convertible debenture. Those, from accounting treatment

perspective, those will be treated as equity -like instruments. So, that's the first question. And from, I think you may be also referring fr om a consolidation perspective, actually, the treatment remains the same.

It will be fully consolidated with Adani Green because operational control and other elements continue to remain with AGEL.

Nirav Shah: Got it, sir. Got it. Great. Thanks, sir. That's from my side. I wish you the best.

Moderator: Thank you. The next question is from the line of Nikhil Abhyankar from ICICI Securities. Please go ahead.

Nikhil Abhyankar: Thank you, sir. Thanks for the opportunity. Sir, we haven't seen you participating in new bids while they are also getting undersubscribed, a lot of bids. So, can you just throw some light? When can we see you start participating? And in terms of preferen ce, what will be your preference, solar, wind, hybrid, or even F DRE?

Amit Singh: Yes. I think it is very clear that we have to match our existing lo cked in portfolio with our execution pace and capacity. So, today, as we had earlier guided, our execution capacity is in the nearabouts of 2.5 gigawatt.

We are working hard to grow that capacity to north of 5 gigawatt from next year. And we need to make sure that we time these in such a way that we maximize our returns. And as you heard me say earlier, we are also looking to optimize our balance between so lar, wind, but also from a C&I merchant capacity as well, which, as you know, we are – we have a very small exposure there.

So, we are looking to balance or rebalance our portfolio and hybrid, our overall mix. So, that's the reason why – but we will selectively participate where we feel we can get the best returns. I think in terms of solar mix and maybe to add more color, I'm going to invite Raj as well to add a few points.

Raj Kumar Jain: Sure. Thanks, Amit. So, I think it's high -grading the portfolio is what we are going to do for the future. So, that's where the focus is. And as Amit mentioned, we are looking for mix which can give us – give the shareholders best returns in this case. Within the space, whether it is solar, wind, hybrid, or F DRE or RTC or whatnot, for us all those opportunities are there.

And I think we definitely don't have any singular preference in that. I think it's the subject of what opportunity gives us more return. By its own nature, as you know, the renewables will always be solar heavy. So, obviously that ratio will be higher. But for us, all those opportunities are available on the table and we choose based on return profile and our expertise within that profile.

Nikhil Abhyankar: Understood, sir. So, you mentioned that you're facing some problems in improving your execution capacity. So, what kind of problems are we facing? Is it like supply chain? Is it land acquisition or what?

Amit Singh: No, I would not call problems. I think we had an existing run rate of how we execute and we are growing that run rate. I think if I give you three things which I talked about in my opening remarks, the first is really having a very clear transmission netwo rk available to evacuate power.

And for that we have to rely on execution of different transmission companies in the country.

And they have to be able to deliver and make sure that the evacuation is available. The good news is, for example, in Khavda, the first evacuation lines are ready and we have a new capacity added of 3 gigawatts.

Second is really about managing supply chain. And supply chain, when you grow a supply chain and ramp up at this scale and speed, there are long lead items and manufacturing capacity limitations which are in place, both from wind and solar perspective, inv erter, tracking systems.

So, those have to be developed and those have to be – there is a time it

takes to invest and grow
that capacity.

We started on that journey nine months ago. And a lot of our partners are scaling up to deliver the north of 5-gigawatt scale for next year. And the third is people. Renewable sector is still in an early growing phase in India. We have to hire the best people, train them, mobilize them to

some of those project sites like our flagship site in Khavda. This is a place where t here was no human being living there.
And now we have north of 5,000 people working hard and delivering projects. So, it's an ongoing journey and we are very happy with where we are. And we know that we have still a long way to go to get to the scale we are talking about for the following quar ters.
Nikhil Abhyankar: I'm going to – going to pump ed storage. So, what are our plans and when should we start the execution on this project? When should we expect the execution to start?
Amit Singh: I'm going to invite Raj to maybe give a bit of color on the pump storage and then maybe I can comment on the execution.
Raj Kumar Jain: Yes, sure. I think just on the background side as you all know that generally the pump ed storage piece takes close to five years from the day zero until the actual commissioning of the project.
So we have signed a lot of MOUs. You would have seen in the media that a lot of MOUs have been signed, AP, Government of Maharashtra, Telangana, Tamil Nadu, and all. So we are making our progress on multiple sites. Full detailed feasibilities are there.
Feasibility studies are on which will lead into execution decisions. We are very close to doing one project. And I think that's something which we will be able to come out very soon and give you the details. However it is part of our overall long -term str ategy when we talk about FY30 that how we are mixing all sources of renewables in the ever -emerging space of RE .
How do we ensure that we benefit out of the opportunities which are being thrown or the complexities which are being thrown as a leader in the pack? How the pump ed storage or other forms of storage are used so that my returns are much better than what traditionally I have been able to earn. So, there is clear focus on pump ed storage and you will see some of those happening.
At the same time, we are very, very vigilant about, very diligent about that whatever we do is definite, is complete and all approvals are taken because a lot of these projects have seen in the past a lot of delays, a lot of stalling, a lot of questions w ith respect to R&R, environmental permissions, and all of that.
So when we say that we are doing something, we want to be 100% clear on everything and that's what I think one of those projects we will be able to come to you very soon and balance in the very advanced stages as well in various forms in various states. Bu t again, rehashing the point,

it is completely part of our plan for FY30 to explore this, the problem which the industry has, how do we create opportunity out of it and actually give better shareholder returns to our shareholders.
Management: And just to add to what Raj is saying, in terms of the timelines and all, it is pretty clear that the first type of project which Raj is talking about will be a part of our implementation process as far as next financial year is concerned. So we will defin itely be starting our PSP implementation from next financial year and the project which Raj is going to be talking about anyway s is in a very advanced stage with environmental clearance already received, land already going to be acquired.
And financial closure is in a very advanced stage of being completed upon. So once financial closure is achieved, along with our formal storage business philosophy per se, we will be coming out with a specific guidance on that.
Nikhil Abhyankar: Okay, understood. Just a final question, sir

. What will be the capacity addition in the final three months?
Amit Singh: I think in the next quarter, I think we feel that we will be north of 2 to 2.5 is what we are targeting.
As I pointed out earlier, our evacuation capacity is now ready. A lot of solar and wind capacity is getting commissioned and we have a very high rate o f commissioning going on trials. And we will make those announcements as we go.
Phuntsok Wangyal: Yes. And just to be very specific, at least we will be adding 2 gigawatts in this quarter actually.
Next two months, just to be precise .
Nikhil Abhyankar: Yes, understood, sir. Thank you and all the very best.
Amit Singh: Thank you.
Moderator: Thank you. The next question is from the line of Uma Menon from Alliance Bernstein. Please go ahead.
Uma Menon: Hello, am I audible?
Viral Raval: Yes.
Uma Menon: Yes. Thank you so much for taking my question. The question is mainly on your capacity addition for the next three months. Essentially, just wanted to understand since you spoke about transmission, is transmission one of the major problems that is affectin g the capacity addition capability? Just wanted to get to know your thoughts on this?

Raj Jain: Yes, Uma, this is Raj. You know, that's where what the advanced planning does. So, when we say that these are the challenges, the challenges are there for the industry. When I'm looking to do 5 gigawatts , I'm looking to do more than that. I have already solved it. So, if I am saying that I'm going to do, say, five plus next year, I've solved the land point.

I have solved the transmission planning for the next year or year next. I have also solved the manpower planning for the next year. However, it is very important to remain modest about it. And that's where we are saying that these are the challenges which the industry faces. For us, as leaders in the pack, we need to ensure that when we say that we are doing it, we are taking them head on.
So, when I say I have land of 2 lakh acres, my complete plan for 45 gigawatts on land side is solved. When I say that I will be doing 45 gigawatts by 2030, I have clear visibility of when the transmission elements are coming in, which sector, and I have zero risk on the transmission planning as well as the grid comes in for the national network.
Yes, there are embedded plus minus three months to six months which happens, which for various reasons, that's fine. Apart from that, there is no such risk. Now, in terms of making the thing business as usual, we have already worked where we are executing close to 3 -plus-gigawatt.
Now, when we move to 5 -plus-gigawatt next year, the ecosystem required to be built in Khavda is already done. We are fully ready for it. So, I think from a risk perspective, we have already covered ourselves. But these are the three things which we have so lved to be able to deliver it next year. So, I think that's the way you should look at it.
Uma Menon: Understood, sir. Thank you so much and good luck.
Raj Jain: Thank you.
Moderator: Thank you. The next question is from the line of Nikhil Abhyankar from ICICI Securities. Please go ahead. Mr. Nikhil Abhyankar, we are not able to hear you.
Nikhil Abhyankar: Yes, sorry. So, we are transferring around 1 gigawatt to the JV. So, what is the expected EBITDA from this JV and what is the debt level on these assets?
Phuntsok Wangyal: So, I think from our business perspective, actually, as I was saying, even if we transfer this, it will be fully consolidated, actually. So, from that perspective, it will be reflected in our numbers.
Now, if you are talking in terms of debt level, actuall y, as we have guided, 1050 megawatt includes 300 megawatts of operational.
Balance capacities are under execution. So, those under execution projects anyway does not have any amount of debt per se, actually. Those will

be implemented as a part of my coming
year execution plan. So, our debt which will be transferred as a part of that platform should be nearly Rs. 1,500 crore .
Nikhil Abhyankar: 1500 crore. Okay, understood. And what will be the expected EBITDA from this portfolio?
Phuntsok Wangyal: Yes, so, from EBITDA perspective, if you really see, my portfolio doesn't vary much, actually. As far as the 300-megawatt operating portfolio is concerned , accordingly, if you really want to see, this should have an EBITDA between 190 to 200 crore . EBITDA margin will definitely be higher than my portfolio level EBITDA margin.

Nikhil Abhyankar: Okay, understood, sir. That's what's on my side.
Moderator: Thank you. The next question is from the line of Vijay Kumar from Avendus Spark. Please go ahead.
Vijay Kumar: Yes, so, my first question is on the existing module prices, which has come down significantly. And how is it going to have a positive impact on our returns on projects since we would have already locked in on tariffs while now probably the cost would be lower? Would that be beneficial to us now?
Raj Kuma r Jain : Yes, sure. So, as any module price will obviously have a saving on the capex, and that obviously improves the returns. So, the number is broadly 1.2% to 1.3% additional equity IRR for every cent of production. Now, for projects which are…
Vijay Kumar: Sir, you said 1% to 1.3% improvement in IRR for every cent of production, is it?
Raj Kumar Jain : Yes, yes . So, now for projects which are, say, commissioned this year, they will be on a different price trajectory for the projects which get commissioned next year will have a different price trajectory. And we have to also see that some of these are bottom price s in the module environment. So, do we see that these prices sustain in future at these levels is also something

which we build in our capex estimates.
So, I think from that perspective, you will see higher returns from the capex which we are doing than what we had estimated at the start of this financial year. And the same will continue for next year. And we continue to monitor this thing.
However, we do not necessarily see now a meaningful reduction from the current levels, because some of this is going to the marginal cost of production right now in China.
Vijay Kumar: Okay. So, how would the implementation of ALMM from April 2024 change all this? Because then we will have to procure for new projects only from Indian manufacturers. So, the lower cost of any modules will anyway not be beneficial to our site.
Raj Kumar Jain : So, two parts. One, most of my or virtually 97% or 98% of my balance locked-in portfolio, PPAs do not have ALMM applicability. So, whatever I buy for them, I can buy from China. And again, from that 97%, I will have a pass through of BCD on that from SECI or the relevant DISCOMs .
So, I don't need to necessarily worry about the ALMM or the BCD per se in my business model.
Second, so that's where my returns are protected and those are good in terms of me being able to take the current low module prices and module prices environment benefit in my capex. Now, going forward, obviously, when we tender for projects, we take care of what will be the regulatory framework going forward, which also includes the ALMM, what is the pricing scenario in the domestic market.
Just to further take the point forward, currently, the domestic prices for ALMM certified modules, which are not necessarily DCR modules, the prices are broadly nothing but what you

import from China plus the BCD on it, and a small margin over it. So, that's where the domestic prices are hovering.
So, per se, for any new future bids or even for any merchant or a C &I project, which I implement, it does not change the middle too much

, especially in cases where obviously the revenue profile is going to be better than the PPA thing. In case of PPA, obviously, this ALMM applies to everyone in the industry in my competition. And second, my returns are generally which is superior to what the market is able to earn for those revenue numbers. So, I think we are fairly hedged on this ALMM matter .
Vijay Kumar: Okay, sure. So, that is good for us. One question on what you had mentioned, you are telling domestic prices are Chinese prices plus BCD plus margin. So, that means $0.10 cents plus 40% plus some margin, would it be still be under $0.20 cents for what if for domestic manufacturers?
Raj Kumar Jain : So, $0.10 cents is not necessarily the best price. Yes, you hear some of those things, but then you are going down on the quality chain, then you are going down on the whether it is tier one or not, and some of those things, whether it is top con or not. So, let's not necessarily take that number. But yes, over that you apply 4 0% duty, transportation, and then some more margin for the domestic things, because they essentially procure cells or wafers from that market.
And the way the pricing is there from Chinese market is that they are pricing obviously wafers higher than the inherent cost so that the modules manufactured in other places in the world are costing higher than their own ecosystem. But it is around the number which you have quoted.
Vijay Kumar: And that $0.20, sorry, may not be your domain, meaning not Adani Green's domain, but at $0.20 cents, will the domestic manufacturers make returns?
Raj K umar Jain : It depends on domestic manufacturers own efficiency. And since I am not speaking on behalf of Adani S olar, I may not be able to comment too much on that, but I think the way I understand the business has been made very efficient and the ecosystem there has been made in a way that a lot of things are channelled into the ecosystem there itself so that the c osts are controlled and the efficiency have been optimized. So, I think I'm sure efficient people are making money.
Vijay Kumar: So, one final question on pump storage. We are hearing several developers coming up with a lot of new projects on the pump storage, but how is the equipment ecosystem to support this large ordering activity that will happen over the next, say, five years to 10 -year period to set up these projects? So, do we have the equipment supply base in India to supply these equipment's?
Raj Kumar Jain : So, two or three parts of it. One, I think it's a lot of announcements. Let's see how much goes actually on the ground because, yes, it is the need of the hour for the country. It is accepted and it is where the opportunity lies and big players who have th at execution capability will be able to tap this. So, only a few of them is what I believe will be actually translated into real projects.
So, that's one.
When it goes into the projects, then only the need for equipment arises. At the same time, given the time period available for some of these projects, it is possible for the developers to lock in the equipment ecosystem for them and that's what helps. And when we say that we are

developing a pump ed storage part of our business as a next frontier for a higher return portfolio,
then obviously, that is one area which we have looked at very seriously and work with our
suppliers to ensure that we are the best in that area.
Yes, it's a huge opportunity for the equipment manufacturers to see how do they augment. But I
think it's also a chicken and egg in the sense how many people actually give them orders and
how many people talk about orders.
Vijay Kumar: I understand. Got it. Thanks for answering my questions and all the best for the future.
Raj Kumar Jain : Thank you.
Moderator: Thank you. The next question is from the line of Uma Menon from Allian

ce Bernstein. Please
go ahead.
Uma Menon: Hello. Thank you for allowing me to jump in again. Just one question. Just wanted to understand
what would be the main reason that you would attribute not being able to achieve a 2.5 gigawatt
in the next three months versus, like you said, at least two gi gawatts in the coming quarter?
Amit Singh: No, I think there's a lot of moving parts, Uma, in the renewable project, right? And I think it's
about deploying, doing the trials, having all the elements ready, commissioning them,
connecting them to the grid, and making sure that we provide a very sustained, efficient supply
of green electrons. And we have to do it in a manner that it is properly compliant with the rules
and regulations. So, obviously, we will maximize our output and maximize our performance,
but I think we have to be cognizant of the fact that there are things sometimes outside our control.
Won't be able to give too much color on that, but we're very confident that we will be towards
the higher end of that number as a total number for our performance by end of the year.
Uma Menon: All right. Thank you so much, sir. Thank you.
Moderator: Thank you. As there are no further questions from the participants, I now hand the conference
over to management for closing comments.
Viral Raval: Thanks a lot, everyone, for participating in the call. And please feel free to connect with us if
you have any further questions. Thank you, Mohit and ICICI Securities for organizing this call.
Thanks a lot. Bye, bye.
Moderator: On behalf of ICICI Securities, that concludes this conference. Thank you for joining us, and you
may now disconnect your lines.

Dear Sir,

Sub: Transcript of Earnings Call pertaining to the Audited Financial Results for the quarter and year ended March 31, 2024

With reference to above, we hereby inform below link of transcript of the Earnings Call on Audited Financial Results (Standalone and Consolidated) of the Company for the quarter and year ended March 31, 2024 held on May 03, 2024.

Web link to access above transcript is: https://www.adanigreenenergy.com/-/media/Project/GreenEnergy/Investor-Downloads/Results-Conference-Call-Transcript/Q4-FY24.pdf

Kindly take the above on your records.

Thanking You

Yours Faithfully,
For, Adani Green Energy Limited

Pragnesh Darji
Company Secretary

“Adani Green Energy Limited

FY24 Earnings Conference Call ”
May 03 , 202 4

MANAGEMENT : MR. SAGAR ADANI - EXECUTIVE DIRECTOR
MR. AMIT SINGH – CHIEF EXECUTIVE OFFICER
MR. PHUNTSOK WANGYAL – CHIEF FINANCIAL
OFFICER
MR. RAJ KUMAR JAIN – HEAD BUSINESS
DEVELOPMENT

MR. VIRAL RAVAL – HEAD, INVESTOR RELATIONS

MODERATOR : MS. HINAL CHOUDHARY – INVEST EC CAPITAL SERVICES INDIA LIMITED

Moderator: Ladies and gentlemen, good day and welcome to Adani Green Energy Q4 FY24 , FY24 Earnings Call. As a reminder, all participant lines will be in the listen -only mode and there will be an opportunity for you to ask questions after the presentation concludes. Should you need assistance during the conference call, please signal an operator by pressing * then 0 on your touchtone phone. Please note that this conference is being recorded.

I now hand the conference over to Ms. Hinal Choudhary. Thank you and over to you, ma'am.

Hinal Choudhary: Thank you. Thank you, Sagar. Good Evening. On behalf of Investec, we welcome you all to Q4 FY24 and FY24 earnings call from Adani Green Energy. Today, we have with us from the management, Mr. Sagar Adani, Executive Director, Mr. Amit Singh, CEO, Mr. Phuntsok Wangyal , CFO, Mr. Raj Kumar Jain, Head Business Development and Mr. Viral Ra val, Head IR. I now hand over to management for opening remarks followed by Q&A. Thank you.

Sagar Adani: Hi, thank you very much, Hinal, for organizing the call. Good Afternoon, Morning to everyone from all across. It's a pleasure to connect with all of you. We'll just give you a brief update on AGEL results and then open up for Q&A right after.

This is Sagar Adani and I'll just start. So Adani Green Energy is India's first and the fastest renewable player to get to a 10.9 GW of operating capacity. It is a testament to our focus on project execution, operational excellence, building resilient supply chains, innovation and leveraging technology to enable affordable and renewable power.

In FY24, we strengthened our market leadership with 2,848 MW of greenfield capacity addition, which marks a 35% year-on-year increase. The capacity addition by Adani Green alone accounts for over 15% of India's total renewable capacity addition in FY24. We are developing the world's largest single -location renewable energy plant of 30,000 MW in Khavda . This project will set a blueprint for ultra-large scale renewable energy development globally. The project is spread across 538 square kilometers, almost 5 times the city of Paris and will be completed fully by 2029.

In fact, in the same location, we have already operationalized 2 GW of solar capacity in FY24, just within 12 months of breaking ground there.

I'm glad to share that in FY24, we delivered a robust performance across all metrics on a year - on-year basis.

• Our revenue from power supply increased by 33% to INR 7,735 crores.
• Our EBITDA increased by 30% to INR 7,222 crore.
• The run-rate EBITDA stands at a strong INR 10,462 crores.
• The net debt to run-rate EBITDA is at 4 x compared to 5.4 x just one year ago. Cash profit has increased by 25% to INR 3,986 crore.

• Our consistently high operational performance has enabled us to deliver an industry - leading EBITDA margin of 92%.

Our investors have also reposed tremendous faith in our strategic vision. AG EL has further strengthened ties with strategic partners and investors including Total Energies, GQG Partners, and Qatar Investment Authority. We have also refinanced Restricted Group 1 bond with a fresh 18-year bond issuance of US $409 million, which was oversubscribed 6.5x.

Our continued focus on improving performance across ESG parameters has significantly advanced our rankings and ratings by globally recognized independent bodies. In its latest assessment, ISS ESG ranked AG EL 1st in Asia and amongst top 5 in the RE sector globally. CDP rated AG EL in the topmost category of ‘A’ for Supplier Engagement and ‘A-' in the Climate Change Assessment.

India's green power revolution is underway at a very accelerated pace. This necessitates developing utility -scale storage projects in a speedy and cost -effective manner to support the base load req

uirements of the country and to complement the higher capac ity of renewables
coming into the grid.
Pumped Hydro Storage, a mature and proven technology, emerges as a robust solution. We are targeting at Adani Green an addition of at least 5 GW of pumped hydro storage capacity by 2030 and have already kicked off construction work for the first 500 MW project in Andhra Pradesh.
With this, we have revised our renewable energy capacity target for 2030 upwards from 45 GW to now 50 GW.100% of this capacity is already fully funded from both a debt and equity perspective.
We are on track to achieve the 2030 target with locked -in land parcels and transmission connectivity in Rajasthan and Gujarat. We also have a development pipeline for pumped storage projects across four states in India.
We are committed to lead India's energy transition and we aim to more than double our green field capacity addition to 6,000 MW in the current fiscal year.
Thank you very much and we'll open up for questions.
Moderator: Thank you very much. We will now begin the question -and-answer session. Our first question is from the line of Mohit Kumar from ICICI Securities. Please go ahead.
Mohit Kumar: Yes. Good evening, sir. Congratulations on a very, very good set of numbers. My first question is on how to think about the capacity addition beyond 20 GW. If I understand correctly, you've got 20 GW locked in PPA. But I don't think we are bidding right now and we're not participating in any of the bids.
Sagar Adani: So, Mohit, yes, you're right. We have 20 GW of locked in PPAs. We are also actively pursuing C&I customers, specifically high -rated counterparties for C&I and various other Adani Group companies as well, which would require power for their own decarbonization requirements over the next few months an d years. So, in due course, when relevant contracts are signed, we will

update to the market. But at the same time, we will ensure that , in the next two -odd years, we're executing contracts for which have tied -up counterparties.
In the next 2 years, you will see significantly higher locked -in contracts, which will be of a similar nature, of a similar number, that we will execute across various counterparties as well as participate in specific value -added tenders . In the context of the energy demand of the country right now , there are various opportunities that are very attractive. We don't want to participate in simple plain vanilla PPAs, wherein the returns wouldn't be as attractive what we would be able to get otherwise. So we're pursuing a lot of alternate options .
At an appropriate point in time when things are locked in , we'll disclose to the market, but the underlying theme remains that at higher margins and at higher profitabilities, we will look to lock in capacities with various counterparties consistently as we go forward.
Mohit Kumar: Does it mean that you're not participating in the upcoming SECI bids of hybrid or storage, anything? Is that the right understanding?
Sagar Adani: So, from a storage, etc, point of view, we may look at specific bids on an opportunistic basis. It's not that we just absolutely won't participate or that we will participate for every single one of them. We will look at it on a very tactical basis, lookin g at the capacity that we have available, because we are executing a run rate of about 6,000 MW of greenfield capacity addition every year.
In future years as well, we should look at executing somewhere between 6,000 to 8,000 MW every year of new capacity that we will have available. So, what we want to look at and lock -in is out of the 6 GW that we will physically construct, how much of that do we want to allocate to PPAs, how much of it do we want to allocate to C&I customers, high -paying, high -credit counterparties , how much do we allocate for various

other Adani Group companies for the
decarbonization requirements . So, we have that thing th at we look at on a little bit of a tactical basis, depending on the various factors in a particular year. But from a capacity addition perspective, we would add a capacity of somewhere between 6,000 to 8,000 MW on a run rate basis going forward.
Mohit Kumar: Yes, sir. My last question, how do you bifurcate the land allotted in Khavda between various group companies? Thank yo u.
Sagar Adani: We don't bifurcate any land to any of the group companies. Adani Green owns the land, and Adani Green executes the project on that land. From a counterparty perspective, that's what I just said. Adani Green prepares the project, sets the project up, and sells electricity to various other companies. So, in that sense, in that particular year, depending on, again, the project mix, it depends on which group company gets how much in terms of power cap acity.
Moderator: Our next question is from the line of Nikhil from Bernstein. Please go ahead.
Nikhil: Thank you for taking my question, and congratulations on a good set of numbers. My first question is on the guidance that we can expect for the commissioning of new capacity in the

coming fiscal '25 and fiscal '26, if you could please share that.

Sagar Adani: So, as I said, Nikhil, we will be in this coming year, we will plan to add at least about 6,000 MW of greenfield capacity in FY25. In FY26, we should have a similar or a slightly higher number, but it should be in a similar range, as I said earlier as well. We aim to execute a greenfield capacity of somewhere between 6,000 to 8,000 MW in a given year.
So, our land tie -ups, our evacuation tie -ups, our execution capacity, vendor participation, our financial plan are all ramped up to be able to deliver a capacity of somewhere between 6,000 to 8,000 MW in a year. This year, our target is north of 6,000 MW.
Nikhil: Perfect, understood. If I may ask a follow -up to that, do you see any challenges coming in from availability of equipments, whether it be panels due to ALMM or transmission equipments like transformers, which we are hearing a constraint across the board? D o you foresee any of those challenges coming in for you?
Sagar Adani: For us specifically, we will not have any of those challenges.
Nikhil: Understood. And even evacuation from a grid standpoint from Khavda , that's...
Sagar Adani: Would also not be a problem. So when we talk about the target and the plan to add 6,000 MW of capacity, that we do ourselves consider every one of these factors in terms of the supply chain, in terms of the evacuation, in terms of the capital availability, in terms of the organizational capability. We factor in all of those things and then discl ose our own internal target to the market.
Nikhil: Great. Makes sense. Then the second question I had was regarding , I think this was alluded to a bit earlier as well. So, we understand you've got a very big pipeline to commission, hence possibly missing from the tenders last year. But there were also some very good complex tenders which happened, FDRE tenders, which see med at very good prices, giving good returns. Was the reason to not participate in them a strategic one that you expect more such and possibly more attractive opportunities to come? Or was it a factor of the timeline of the pumped storage plan coming in 2027, and that's something that you would want to work, the project commissioning to align with that?
Sagar Adani: So, Nikhil, good question. From our side, basically what we see, we are not very, very hung up by one particular tender of SECI. What we're playing is a much larger strategic renewable energy game in the context of the Indian market. Now, there is one there'll probably be 10 other tenders that will come. When we look at it, you just take a step back and

look at it from a thematic perspective. From an India standpoint, India currently is already expecting a huge growth of consumption from an ene rgy perspective. Now, of course, we all want to make sure that a majority of that chunk is serviced by renewable energy capacity. If you just put in that context a number of what the physical commissioning that would require to service that, incremental demand every year, the number is pretty staggering.
So, one bid or a couple of bids here or there is not very important. What is important for us is we build our capacity, we build our portfolio of generation, be that solar capacity, wind capacity, pumped hydro, all of that up in such a way that we have a v ery unique set of solutions for the end customer. Now, the conduit of reaching the end customer could be via SECI bid, could be

via an NTPC bid, could be via many different ways, could be a bilateral contract, could be some DISCOM bids that may come out, state level DISCOM bids that may come out.
But ultimately, what we want to ensure is we build the AG EL portfolio up in such a way that the expected demand profile of the country over the next five years is able to be met in a very significant way by our product portfolio. So, that's how we're thinking about it. Now, if we're in a position to be able to pr ovide capacity and products and services, which other renewable energy companies cannot, we expect there to be a significant margin and delta that we'd be able to make because of that one particula r thing. Does that help you answer your question?
Nikhil: It does. And what I took away is that you have the potential and awaiting patiently, you expect more such opportunities to come given the scale of supply that's needed, as you said, for the transition.
Sagar Adani: Because we're in a very unique position, Nikhil, to have the ability to not, unlike most other companies, right, with balance sheet capacity of AG EL, group strength, to be able to build projects without necessarily need of specific contracts, to have the financial capability to build looking forward to the contracts, not build only after contracts are in place. And then that differentiator gives us t he delta of additional profitability significantly. Because we don't have

to compete where 20 ot her people are already.
Nikhil: Makes sense. And if I may ask a related point, similarly on pump storage, then I'm guessing there is no PPA because there hasn't been many tenders. But the plan would be, again, like I said, depending on what opportunities come your way, what could be the best return, that's how you want to look at and capital is not a constraint.
Sagar Adani: Correct. So when we're looking at pumped hydro, Nikhil, in a way that it's a strategic alternative to batteries, there are going to be tenders that are going to come in which will require deployment of batteries for ensuring that there is a much more commi tted supply profile that can be committed to the counterparties. Now, for most of the other people, if you want to achieve that level of , kind of specificity, you have no choice but to go for batteries, which is how a lot of recent tenders hav e come up from SECI and other counterparties as well.
Ultimately, what batteries are doing is providing storage. The same thing can be done by pumped hydro storage as well, which is significantly cheaper to build compared to batteries. So what we're doing is we're having a strategic option by creating a pumpe d hydro storage project where we will be able to, I mean, if it's, let's say, 30% just using a broad number cheaper compared to a lithium ion battery storage plant, then that is immediate delta available for us in terms of how we can price this, because t he alternative for that would be a lithium ion battery storage option, which would be significantly more expensive for someone el

se to make. So this becomes a
significant margin as far as that option is concerned. So that's why we want to build and retain this option to ourselves.
Nikhil: It makes sense. If I may ask one more question, there was a point made earlier that the 50 GW aspiration, which I think is great and we obviously clearly need in India, but it's fully funded.

But when we do the math, I see from the equity standpoint, we see a need for equity raise to reach that kind of scale, assuming we're not divesting assets, which I think is not the plan. So just wanted some clarification on that from the 50 GW, the equity requirement would be quite substantial. So without any additional fundraise, you see the ability to fund it from existing or operating cash flows?
Sagar Adani: Not so. So to your point, Nikhil, we've done the math and we've done all the considerations, the simulations for everything to get to the number that we publicly declared of 50,000 MW by 2030. From a debt perspective, of course, we have construction facilities tied up , we have very deep access to the Indian markets. And basically with the amount of capacities that we already have tied up today in terms of revolving facilities, we more or less get to that number because it gets churned and recycled every year , so we get to that number broadly . From an equity perspective, the internal accruals that the company makes and the commitment that the promoters have made by way of subscription of warrants into Adani Green. Both of those things put together ensure that 100 % of the eq uity requirements are fully funded to get to 50 GW.
Nikhil: Understood. Maybe just one last question, if I can squeeze in on the merchant power side. So good to see the increase in merchant exposure in the future portfolio to 10 % and the undercut of 11 GW. But also, do you see a risk to that given, globally, solar power prices are becoming negative?
Sagar Adani: Nikhil, India is a very, very different animal and a very different set of considerations compared to many other places in the world. So it would be very wrong to kind of borrow off from specific commercial experiences in other places in the world versus w hat the situation in India is. So I say that. So that's number one. Second ly, if you still look at the deficit that India has overall in terms of requirement at the peak . India, from a climate perspective, is a summer country. So the peak dem and and the peak requirement comes in many places through the summer and many other months in the afternoon. So solar actually, in that sense, unlike many other Western countries, is perfectly complementary to the demand of the Indian grid. That's number o ne. Second, if you look at, again, just very, very, very conservative simulations in terms of what will be the requirement of additional capacity of power in the afternoons, in the evenings, which solar and wind very beautifully complement, there is a very , very significant shortage that is expected to come up over the next two, three, four years.
Even if you look at current year numbers in terms of energy growth, what is expected to be even higher next year and the years forward. If you take a 5 year simulation, the numbers are very very staggering in terms of what India would require. So from that perspective, we don't see as many PPAs and tie -ups happening by the DISCOM s, by various other agencies and companies to cater for that increase in demand. So we see a very clear three to four year runway where we'd be able to make substantially better margins , if we have additional capacities that are catered towards the merchant market.
While I say this, at the same time, we also will continue to ensure that we look for very specific,

profitable, not plain vanilla opportunities where we are able to make higher deltas in terms of our profitability. And at the right and ap

propriate point in time, we will be very open and we'll

be very willing to tie up these capacities in long term PPAs as well. So we always keep an eye out and we keep a lookout for that. But at the same time, want to also ensure that we use shorter term opportunities to generate better profitability for the portfolio.
Nikhil: Makes sense. Thank you so much for answering my questions and congrats again for great execution.
Sagar Adani: Thank you.
Moderator: Thank you. The next question is from the line of Ketan Jain from Avendus Spark . Please go ahead.
Ketan Jain: Good evening, sir. I just had a follow up question on a question previ ously asked on battery storage . With the fall in battery prices are we looking to add any battery storage based hybrid projects?
And also with the fall in prices does the tariff get competitive with pump storage l ike how does the tariff of both projects compare?
Sagar Adani: The right way to look at it, Ketan, is that there is demand on one end in terms of what is the amount of power required at one point in time. So the tender always asks for demand. The tender never or a consumer never asks for a specific source of power. So on one hand is the demand , which is the bid s that are coming from SECI , which is bid s coming from all of these different counterparties , C&I opportunities and the likes. On the other hand , we as generators - Adani Green and many of the other companies - we have to decide what are the sources of power through which we want to cater to this demand. Now, in many of the cases p eople cater to this demand by way of battery storage. That' s the majority of what people are doing, and that's the majority of how things have happened all across the world as well.
From an Indian context, we have an additional source of power, a generating source of power that is pumped hydro. Pumped hydro , because of the way the industry works and because of the way concessions work in India , is not easy. B attery storage it's very easy to buy a bunch of batteries, you put them, you link them to a solar plant and you have this capability of providing renewable power with storage capability as well. So there's much, much lesser barriers to entry.
On the other hand, pumped hydro is sort of like a full fledged infrastructure project. It's not as easy and simple to execute as a battery storage project. But at the same time pumped hydro is much cheaper. So what we always ensure and what we want to make sure is that we have a bouquet of solutions that are available for consumption of our end customer.
At the same time, from a generating perspective we are able to generate this solution at the cheapest possible rate in the market. That's how we look at it. So there's a role that pumped hydro storage plays as well. There's a role that battery plays. There's a role that solar and wind plays. There's a role that every one of these generating sources plays. But what we want to ensure is we have access to these generating sources in a way that is the cheapest. So that we can generate the highest margin for the same tariff in the market.

Ketan Jain: Yes, understood. I just want to understand that. So you're saying India will need a combination of both type of projects like there's not one partic ular storage to be chosen from a nd even if you compare on a standalone basis just the battery and this pump, batteries tariff are to be higher, am I right?
Sagar Adani: That is correct. Yes.
Ketan Jain: And India needs a combination of both. Both are required based on the demand.
Sagar Adani: Absolutely. Yes.
Ketan Jain: Okay. Yes. Thank you.
Sagar Adani: Thank you.
Moderator: Thank you. The next question is from the line of Apoorva Bahadur from Goldman Sachs. Please go ahead.
Apoorva Ba

hadur: Hi Sagar. Thanks for the opportunity. Sagar , wanted to check up on this pump storage project that we are building , what could be the timeline for commissioning over there?
Sagar Adani: So FY27, Apoorva is the first commissioning for plan of 500 MW that we're executing currently.

Of course, as we go along we look at about a 3-3.5 year t imeline for commissioning of a standard pump ed storage project. So whenever we start additional projects somewhere along the way over the next one or two years , those projec ts will get ready in about 3 -3.5 years of when construction is started , from a thumb rule perspective.
Apoorva Bahadur: Understood. And what would be the tentative capital costs on a per MW basis that we are looking at?
Sagar Adani: So we are l ooking at about INR 4.5 crores to INR 5 crores per MW.
Apoorva Bahadur: Understood. So in that case these will be quite competitive on a cost curve.
Sagar Adani: Absolutely.
Apoorva Bahadur: Fair enough. I think a large part of our sort of strategy of utilizing pump storage also rest s on transmission availability and I recollect you said that all this is taken into consideration, but do you think, wou ld we require more transmission purely from a planning perspective?
Sagar Adani: So Apoorva so if that's a question, that's an overall India question that does India require more transmission capacity from a planning perspective? Answer is yes. So the government recognizes that very well also. And the government also ensures that there is a very proactive planning of transmission that is happening in advance of the projects getting ready. So you'll see, I think this year we should expect a lot of transmission bids and transmission capacities expected to be bid out by the go vernment to ensure that all the major renewable generating areas are newly well connected in advance of the projects becoming ready so that when the projects are ready they can immediately evacuate into the grid of the country. When we look at the pump

hydro projects they are, of course, in geographies which have a certain type of a topography. So sometimes it becomes slightly more challenging, b ut whenever we do plan this on our end, we never ever pl an a single project without 100% certainty in terms of transmission, because we never want to be in a situation where a project is ready and it becomes a dead asset because it cannot evacuate. So transmission becomes a very core part of our project planning.
It's, in fact, the most important and which is why you would have seen in the last 6-7 year history, never has it once been that a project of ours has been ready and has been stranded because of lack of transmission capacity. That's something we evaluate very carefully and we make sure that is in place significantly in advance of our project s becoming ready. We time it like that.
Apoorva Bahadur: And that's for sure that's what we have been seeing. So I think you're absolutely right. I think the last two ques tions and I believe like in to one of the questions earlier you had said like the idea is to sort of meet India's energy demand irrespective of the source and the procedure. Continuing on that theme, should we expect any foray on the rooftop side now that the gover nment is pushing for it especially under the RESCO model?
Sagar Adani: So Adani Green, Apoorva , is a platform that is focused on setting up dedicated utility scale, large scale solar and wind projects, of course, with storage solutions as well, pumped hydro, battery storage.
So we will continue to remain in that segment. We don't want to g o into a kilowatt level segment that is something that does not make sense for us. It is left much better to other companies who want to execute that. For us, our focus is and will continue to remain large utility scale development of large scale renewable proj

ects.
Apoorva Bahadur: Great. I think last question. If you can share the latest capital cost estimates for solar and wind on a per megawatt basis, what you're seeing now?
Apoorva Bahadur: I just wanted to check on the capital cost for solar and wind, the latest number. And Sagar, one more question, I think. This is regarding your assessment of maybe requirement for wind capacity addition? Now, once the pump storage projects start getting commission ed, because I understand that solar would be the cheapest way to sort of charge them. So do you require – I mean, do you think that surplus wind capacity addition would be required once pump storage solutions start commissioning? And if yes, to what extent?
Sagar Adani: So I think from a charging the pump ed storage plant's perspective, again from a thumb rule perspective, if you have wind capacity, it is best used because it generates very well at peak hours, peak consumption hours. So if you have wind capacity, it is best to sell it into the grid at the time of peak consumption hours, because that's where you make, you know, quite significant in terms of delta. What you would typically want to do is utilize the excess solar energy generated during the day to charge your pump storage plant. That's the logical way in which you would typically want to do that from an economics perspective.
Now, will we need to add additional wind, not specifically from a pump ed storage perspective, but from an overall country demand perspective and demand profile perspective? Absolutely.

The more that the wind is added in terms of jointly together with solar, the better it is from a grid stability perspective.
Apoorva Bahadur: Okay. Fair enough. Understood. First of all, basically for charging pump ed storage, it is not required. So the current, say, sort of trend of overbuilding wind to ensure that a lot of tenders, we are matching the demand curve, right? So that trend should ideally end with maybe pump storage cost acting as a cap over there. Is my understanding correct?
Sagar Adani: No, Apoor va. I wouldn't say that . If you ask me, my personal view would be that we are significantly underbuilding the wind capacity. So, in fact, across the board, all developers from a country perspective as well, we need to ensure a significantly higher development of wind capacity versu s solar capacity.
Of course, it's a little more challenging from an execution perspective, from an operations perspective. So people have a little more hesitation compared to this. Of course, from a resource perspective as well, a little less predictable compared to solar.
But the times at which it generates is very complementary to what India's demand needs are. So, again, from a pump ed storage perspective, I don't think there is that much – solar will be the source that will charge a pumped hydro plant. So wind is not very relevant from a pump ed storage perspective. But, again, from a country perspective, wind becomes absolutely critical and essential.
Apoorva Bahadur: No, I'm just asking from a levelized cost of electricity perspective, right, because solar will obviously be much cheaper than wind. Now, can we overbuild or does it make sense to sort of have so much of pump ed storage? And if it sort of – based on your cost estimates, does it make sense to sort of overbuild solar along with pump storage from a levelized cost of energy perspective? Or does it still make sense to sort of go for wind as well?
Sagar Adani: So short answer, Apoorva, to your question is that ultimately there's going to be a mix of solar and wind that is going to support all different sources. So predominantly pumped hydro is going to be charged by solar mainly because from a levelized cost per spective, it's the cheapest. So that's what we will all endeavor to do completely. But, of course, from a timing per

spective,
sometimes if wind is required, yes, you would want to build that.
Apoorva Bahadur: Absolutely. No, no, I understood that. If you can just help us with the capital cost for solar and wind that you're seeing now.
Sagar Adani: Solar, we look at capital costs somewhere around 5 crores per MW, and wind is approximately 6.5 crore per MW .
Apoorva Bahadur: This 5 crores per MW, is at what DC ratio?
Sagar Adani: That would be at about 1.35 -odd AC -DC ratio.
Apoorva Bahadur: Okay. So this is inclusive of all the BCDs and domestic modules, right?

Sagar Adani: Yes. I mean, of course, these numbers change significantly because modules are like a commodity. They change every quarter in terms of pricing. So I'm just giving you a rough thumb rule estimate. Of course, the specific numbers can keep changing as per how the global market evolves and the domestic market evolves as well.
Apoorva Bahadur: Perfect. Thank you very much. All the best.
Sagar Adani: Thank you.
Moderator: Thank you. The next question is from the line of Nikhil from Bernstein. Please go ahead.
Nikhil: Thanks for taking the question again. I had a couple of more questions. So one is, is there any plan to use the planned renewable capacity to power the green hydrogen projects of group entities?
Sagar Adani: Right now, Adani Green's focus is not green hydrogen. Adani Green has its own independent focus of delivering 50 GW by 2030. That will mainly be used in government counterparty projects, SECI, NTPC, state government DISCOMs, some other decarbonization plans of some other group companies , to make sure that there's some for C&I, for third parties, the likes of large IT companies which consume significant amount of power, data center consumption loads. So mainly these would be the places where Adani Green would focus on right now. Currently, we don't have a plan to allocate a significant amount of capacity for green hydrogen from Adani Green perspective.
Nikhil: And if I may then, this is helpful. Just the other question which came earlier on the solar project cost being 5 crores per MW. Just wanted to understand what are the module prices you are seeing post ALMM in the domestic market? Because I'm expecting it to be a lower number given globally prices are $0.11.

Sagar Adani: So there's a lot of $0.11, but there's a BCD, right? There's about a 40% BCD on importing modules into India. So the actual fair prices from an India standpoint is something around the range of $0.17 to $0.175. So that's more of what the cost of importing modules in India would be today even if you consider $0.11. But independently, from a domestic market perspective, see again, prices vary significantly because it depends from what tenders define . The latest tenders that have been opened by SECI and NTPC have had a price of somewhere around $0.24, I think, for domestic modules. So that's around the price range in which domestic modules are available. Because there's a shortage . There's a demand supply mismatch. We do, of course, expect a significant amount of capacity addition happening in the module and cell market for domestic manufacturing capacity to increase significantly over the next year, year and a half to almost 2 years. So that number should inch towards a downward trajectory. So it should compress. But I think it's more of a temporary issue.
Nikhil: Got it. Understood. But you won't be able to import the modules right now, post 1st April. You would have to rely on domestic or am I wrong to understand?

Sagar Adani: So there's a lot of contractual and regulatory nuances to this answer. There are certain tenders and projects which are exempt from this condition because they were bid out before the ALMM condition came in force. So those projects under thos

e tenders are exempt from ALMM requirements so you can import.
There are certain projects where you can buy ALMM mandatory . So for those projects, you have to use ALMM compliant modules. They are not necessarily domestic. ALMM can also be granted to a foreign exporter. Some factories, for example, exporting from Singapore, Malaysia, who, as we understand, have actively applied for ALMM approvals from the government. It's yet to be seen if they're able to achieve it or if the government grants them the approval, doesn't grant them the approval. So there's a lot of moving parts to this. But I'll try to answer this from an Adani Green perspective. From an Adani Green perspective, everything we're executing this year is fully locked -in and de-risked from an ALMM perspective , so everything, all the modules that we need for our projects .
Sagar Adani: Sorry, I don't know what you heard me last, but I think basically from an Adani Green perspective, we are fully locked -in for whatever we require for the upcoming year.
Nikhil: Makes sense. The 8 GW project on solar side, that I'm gu essing doesn't fall under ALMM.
Sagar Adani: It does not.
Nikhil: Perfect. Understood. And then maybe one last question. From a bookkeeping standpoint, if you could give me a sense of last quarter Q4, how much was the merchant power sale revenue for Adani Green?
Phuntsok Wangyal : I think on a portfolio level, that mix will broadly remain the same, actually. As you know, right now, out of my 10,934 MW, effective merchant capacity, that is going to where PPA is going to not yet signed, is nearly 550 MW.
Sagar Adani: You would assume about a 6.5% to 7% in terms of thumb rule number basis again. But we can get back to you with the exact numbers.
Nikhil: Understood. Thank you so much for answering my questions.
Sagar Adani: Thank you.
Moderator: Thank you. We have the next question from the line of Hinal from Investec. Please go ahead, ma'am.
Hinal: Thank you. Sir, can you just quantify how much CTU connectivity, like, do we have enough CTU connectivity and sufficient land for the set pipeline?
Sagar Adani: Short answer is yes.
Hinal: For like, for the 100% pipeline?

Sagar Adani: 100% of the pipeline, yes.
Hinal: Okay. Also, what is the merchant portfolio contribution right now?
Sagar Adani: It's about 5% of the portfolio in terms of capacity right now.
Hinal: And going forward, we are likely to maintain the contribution?
Sagar Adani: Again, when we say merchant, because, it's merchant capacity for some time, but then it's locked into a C&I customer. So then you do have a PP A and a counterparty after some time. So it sometimes becomes a little fungible. But from a simplicity perspective, you can consider a guidance of about 10% in terms of the mix that we would have that is open, where we would

sell to merchant and C&I put together.
Hinal: Okay, got it. Thank you.
Sagar Adani: Thank you.
Moderator: Thank you. The next question is from the line of Uma Menon from Bernstein. Please go ahead.
Uma Menon: Hi. Yes , I just wanted to ask if there was any infirm power sale that happened last quarter?
Phuntsok Wangyal : No, Uma, I think there is no infirm power sale. If you may recollect, in the past, we have guided, actually, just to be in line with global best practices. Now, what effectively we are doing is as and when plant is charged, actually, that will get reflected in our P&L. So there is no infirm power per se .
Uma Menon: Got it. Thank you.
Moderator: Thank you. As there are no further questions, I would now like to hand the conference over to the management for closing comments.
Sagar Adani: Thank you, everyone, for taking the time out. We are very excited about the journey that AG EL has ahead in front of ourselves. And we hope and we look forward to all of your p

articipation
and we look forward to engaging very closely. Thank you so much.
Moderator: Thank you. On behalf of Inves tec, that concludes this conference. Thank you for joining us. You may now disconnect your lines .

Dear Sir,

Sub: Transcript of Earnings Call pertaining to the Unaudited Financial Results for the quarter ended June 30, 2024

With reference to above, we hereby inform below link of transcript of the Earnings Call on Unaudited Financial Results (Standalone and Consolidated) of the Company for the quarter ended June 30, 2024 held on July 26, 2024.

Web link to access above transcript is: https://www.adanigreenenergy.com/-/media/Project/GreenEnergy/Investor-Downloads/Results-Conference-Call-Transcript/Q1-FY25.pdf

Kindly take the above on your records.

Thanking You

Yours Faithfully,
For, Adani Green Energy Limited

Pragnesh Darji
Company Secretary

“Adani Green Energy Limited

Q1 FY25 Earnings Conference Call”
July 26, 2024

MANAGEMENT : MR. AMIT SINGH, CEO – ADANI GREEN ENERGY LIMITED
M R. PHUNTSOK WANGYAL, CFO – ADANI GREEN ENERGY LIMITED
M R. RAJ KUMAR JAIN, HEAD BUSINESS DEVELOPMENT – ADANI GREEN ENERGY LIMITED
M R. ANUPAM MISRA, HEAD CORPORATE FINANCE – ADANI GROUP

M R. VIRAL RAVAL, HEAD INVESTOR RELATIONS –
ADANI GREEN ENERGY LIMITED

MODERATOR : MR. MOHIT KUMAR – ICICI SECURITIES LIMITED

Moderator: Ladies and gentlemen, good day and welcome to Adani Green Energy Limited Q1 FY25 earnings conference call hosted by ICICI Securities. As a reminder, all participant lines will be in the listen-only mode and there will be an opportunity for you to ask questions after the presentation concludes. Should you need assistance during this conference call, please signal an operator by pressing star then zero on your touchtone phone.

Please note that this conference is being recorded. I now hand the conference over to Mr. Mohit Kumar from ICICI Securities. Thank you and over to you, sir.

Mohit Kumar: Thank you, Neerav. Good afternoon. On behalf of ICICI Securities, we welcome you all to Q1 FY25 earnings call for Adani Green Energy Limited. Today, we have with us the management. I will now hand over the call to Viral to introduce the management, which will be followed by opening remarks, followed by Q&A. Over to you, Viral. Thank you.

Viral Raval: Thank you, Mohit, and good afternoon to everyone. Thank you for joining us in the call. We have Mr. Amit Singh with us, CEO of Adani Green. We have Mr. Phuntsok Wangyal, CFO. We have Mr. Raj Kumar Jain, Head of Business Development. We have Mr. Anupam Misra also, who heads Corporate Finance at the group, and I look after the investor relations. So without further ado, we can begin the call with opening remarks by Amit. Thank you.

Amit Singh: Thank you, Viral. Lovely to have you all here this afternoon.

Let me just start by giving a bit of an opening remark and state some of our operational and financial performance. Adani Green is absolutely committed to achieve 2030 capacity target of 50 gigawatt, including at least 5 gigawatt of energy storage through pump hydro. With secured sites and clear visibility on evacuation, we are firmly on track to meet this target. We are tirelessly working on developing the world's largest single location renewable energy plant of 30 gigawatt at Khavda in Gujarat.

In order to accelerate execution, we have taken three key steps.

■ Deployed advanced robotics technology for the installation of solar modules, which significantly enhances work productivity.

■ We have developed an extensive local supply chain, supporting our execution and contributing to local economic growth.

■ We have established a sustained mobilization of human resources in both Khavda and Rajasthan to ensure a very skilled and dedicated workforce to support our ongoing ramp up.

Yesterday, Adani Green operationalized wind power capacity of 250 megawatt at Khavda. The plant is equipped with India's largest and one of the world's most powerful onshore wind turbine generator, with 5.2 megawatt rated capacity. Khavda has one of the best wind resources in India, as you know, which averages around 8 meters per second, making it an ideal location for wind energy production. This capacity addition boosts the operational capacity of Khavda to 2.25 gigawatts, combining solar and wind sources. It further strengthens AGEL's leadership in India with a total operational portfolio of 11.2 gigawatts.

Reflecting on the financial performance for the first quarter, let me just share with you some key metrics.

■ Our revenue from power supply increased by 24% year-on-year to INR2,528 crores.

■ Our EBITDA from power supply increased by 23% to INR2,374 crores with an industry-leading EBITDA margin of 92.6%. This exceptional margin is driven by tech-enabled operations and maintenance, which are expected to improve further with integration of AI and ML.

■ Cash profit has increased by 32% to INR1,390 crores.

■ This strong financial performance is underpinned by robust capacity addition of 2.6 gigawatts over the past year. Energy sales has increased by 22% to 7,356 million units.

■ Notably, AGEL has consistently generated sig

nificantly higher electricity than the commitments under power purchase agreements. In financial year '24, actual generation exceeded PPA commitments by 11%. In Q1 FY25, generation is already at 31% of the annual PPA commitment.

Let me further share with you some positive updates about our credit ratings.

■ India Ratings & Research has upgraded AGEL's long-term issuer rating to 'AA-' from 'A+', reflecting a strong operational performance, continuously improving leverage and healthy cash flows.

While we have been outperforming in our operations, we continue to implement best-in-class ESG practices across the organization. Let me share with you a couple of recent milestones.

■ Recently, AGEL has been ranked third in FTSE Russell ESG assessment in the alternative electricity segment. The company has achieved the topmost score of 5 in the governance theme as well.

■ AGEL is also ranked among the top five renewable energy companies by ISS ESG and the top ten by Sustainalytics.

Our latest achievements highlight our dedication to setting a blueprint for ultra-large-scale deployment of renewable energy. By integrating innovative technologies, fostering local partnerships and mobilizing a dedicated workforce, we are enhancing our operational efficiency and contributing to a greener future. We remain committed to lead the transition to renewable energy, creating lasting positive impacts for communities and the environment alike.

Thank you and I hand the call back to the host.

Moderator: Thank you very much. We will now begin the question-and-answer session. The first question is from the line of Puneet Gulati from HSBC. Please go ahead.

Puneet Gulati: Thank you so much and congratulations on good numbers again. My first question is, what is your expectation of exit capacity for end of FY25 and '26, and what should be the mix between wind and solar?

Amit Singh: Yes. So I think, as we had guided, we are projecting additional 6 gigawatt capacity for this year, out of which we have just commissioned 250 megawatt wind, which will essentially become a backbone of our operations in Khavda. Going forward, majority of our operations are targeted towards, you know, solar in both Rajasthan and Khavda, but we're expecting close to 700 megawatt of additional wind capacity, which will come in during the rest of the year.

Puneet Gulati: And in this wind side, both for the 250 megawatt which is commissioned, how much of it is your own 5 megawatt turbine, and for 700 megawatt, what is the plan?

Amit Singh: The commissioned turbines are all 5.2 megawatt and in the near future, we are focusing on that platform as well, for maximizing our MUs being generated in Khavda. For other sites we are exploring and we are looking at different options, but I think for now, the focus is to maximize, what we have designed for Khavda specifically. Khavda has a very high frequency distribution of high wind speeds and it requires a particular kind of profile of the blade and different kind of heights and other dimensions.

So, we are making sure that the engineering work we have done, the supply chain we have established, we will make sure that we accelerate our delivery performance and we deliver these numbers for this year.

Puneet Gulati: Okay. Just carrying on a bit on the wind side, your solar plant availability has been upwards of 99%, but wind is about 97%. So, should one assume this is theoretical maximum that our wind path can be, or is there room for this also to expand?

Amit Singh: No, I think you should not look at it as a benchmark. I think, these numbers -- the historical numbers have been across India where conditions are significantly different. We are very confident that, the new generation capacity which is coming through in Khavda, where all the new lines are being commissioned and all the evacuation established, we are expecting a hi

gher degree of availability around, you know, you could argue 98% to 99%.

Puneet Gulati: And for the new turbine, what will be the CUF?

Amit Singh: For the new turbine, I think the average CUF we are projecting in Khavda is closer to 35%.

Phuntsok Wangyal: And Puneet, just to add to the wind availability question again, so as you know, our wind portfolio combines site capacity ranging between 50 megawatt to the recently commissioned capacity of 250 megawatt. What we have observed with the larger capacity and more efficient machines which we have installed, if you really see a breakup of plant availability for either for 250 megawatt or our 325 megawatt in MP, the plant availability is in excess of 98%. So, we do believe that progressively on a portfolio level, our availability will also move towards the levels which we have seen in our recently commissioned large-scale projects.

Puneet Gulati: Understood. That's very helpful. Secondly, if you can also comment upon what is the current borrowing cost that you are experiencing on the new projects?

Phuntsok Wangyal: Yes, sure. So last year we closed with an average portfolio level borrowing cost of 9.4%. What we are definitely seeing from a green perspective is there is massive appetite both at the green

field as well as at the Refinancing level at multiple fronts. What is happening is liquidity per se for green is increasing.
Secondly, the risk spread which a green portfolio is today commanding is much lesser than what we have seen in the past. So some of our fresh borrowings which we have recently done are at a level of less than 9%. What you can say is, it is between 8.6% to 8.9% which is what we are doing right now. Refinancing of our projects are at a level which is even lesser than 8.6%.
Puneet Gulati: Oh, Refinancing is less than 8.6%.
Phuntsok Wangyal: Yes. So, at a portfolio level, as we have guided in our last call, we do expect at a portfolio level my average portfolio interest rate to come down significantly from 9.4%.
Puneet Gulati: And just last bit on your merchant capacity, what is the average realization you are getting on the merchant part of the business and is there an intent to add batteries or BESS as well onto that?
Amit Singh: Yes. I think the merchant pricing, if you look at the last year and going forward, I think if I were to split it between solar and wind, you know the wind pricing has been very strong - we are seeing north of INR 5.5 price realization. So, we feel that a lot of merchant capacity is going to come on the wind side and we will make sure that we continue to grow that as we go.
When it comes to solarwe are not very bothered on spot pricing. As we have explained before, we have a lot of bilaterals. We have a lot of C&I discussions which are going on and we are also making sure that we have play, where there is incidental seasonal mismatch. When the prices are high, you take advantage of the spot market. So we are expecting INR 4-4.5 price realization for solar, which is kind of in the near term. We feel that will be the price for the next few years. And as time goes by, we will make sure that we will de-risk all our merchant portfolio with, different C&I customers being the counterparty. In India, I think it is a big tailwind. I think it was also announced in this year's budget. Our respected Finance Minister talked about how she is going to introduce, efficiency and intensity based carbon regime. This is going to unlock a new sphere of business for C&I. And we being the single largest renewable energy provider, we will directly benefit with some of these trends in the market.
Puneet Gulati: So, just from clarification perspective, the current solar realization also is INR 4.5?
Amit Singh: Yes. Let me maybe bring Raj in as well.
Raj Kumar Jain: So, I think we have seen some seasonal movements in that. And the current re

alization for the
year average until now is around INR 4. However, this particular period of Q1 has seen - last year and the year before as well - some softening in prices because of the way the market works, because more solar is available in that period. However, it will pick up as it picks up every year as we move forward in Q2 and Q3 and later in Q4. So, we expect a good realization north of INR 4.5 for the merchant prices as well for the solar assets.
Puneet Gulati: And Q1 specifically what number would it be?

Raj Kumar Jain: We are around INR 4.
Puneet Gulati: INR 4, Okay. And would it be fair to assume that the new market will focus more on wind than solar?
Amit Singh: No, I think we will optimize that mix. We'll take a call as we go. I think it's fair to say that for wind for sure. I think you will see us making sure that we use wind resources very carefully in premium projects because of the nature of the wind where we have not only high generation of 35% as I talked about, but also the time at which the wind blows in some of these locations means that we can realize very good price.
So, we are very sure that it will stay like that when it comes to wind in premium locations. When it comes to solar, we will mix it to make sure that we service demand for our key customers. But there will not be a vanilla solar merchant. It is not how we are thinking about this.
Moderator: Thank you. Next question is from the line of Sabri from Emkay Global. Please go ahead.
Sabri: Yes. Good afternoon, sir and congratulations on good set of numbers. So, I have a few conceptual questions. Firstly, relating to pumped storage. So, the project that you are currently doing, I think, I mean, there is this open loop and closed loop systems where I think which are like two different variants of pumped storage. So, can you just give us the capex difference between the two systems and the benefits of the two systems? I remember you in a previous call, you mentioned that INR 4.5 crores to INR 5 crores per megawatt is the run rate. So, what exactly

does it refer to?
Amit Singh: Yes. Let me invite Raj to answer that.
Raj Kumar Jain: I think in our case, we said INR 4.5 crores as the cost and that's true for what we have said for our 5,700 megawatt capacity. And that's where the reference is in terms of capacities. In some cases, the turbines will be submerged. In some cases, the turbines may not be submerged. We do not see that we have anything which is open loop in a meaningful manner.
But there are advantages which we are able to have in some cases where, again there are some geological differences there in terms of having available water, which is there already. So all that is being done, but the sites which we have chosen for our development, not only for this 5,700 megawatt which we have guided, but for the future sites as well. We have ensured that those are one of the best sites in the country in terms of the capex intensity in those cases and also has the least implication on the environmental factor, whether it is the forest or R&R and other measures. So, the sites can be quickly developed and also don't have the meaningful impact on the ESG side.
Sabri: Right. So, these are like closed loop systems, but you are still like putting it up near a water source for the fact that the initial water could be like excess from that river. Is that right?
Raj Kumar Jain: Yes. Actually, there are very few cases where we have it and we are not necessarily tapping river waters.

Amit Singh: Yes. I think you have to understand that in a pumped storage, you have to fill the dam once in the life of it, and then you can harvest rainwater or other sources of water. So, that is not a key constraint there.
Raj Kumar Jain: Again, just to explain the point further, see in a normal hy

dro plant, if you want to run that hydro
plant, you need water which can run the stuff for 8,760 hours. Here you need water which is only 7 hours equivalent, and you just pump up and down that water. So, that is where the disturbance to anything which happens is less than 1% of what a normal hydro plant will do. And that's where some of these discussions are not necessarily relevant for PSPs.
But yes, at the same time, we still optimize the sites in a manner whereby some of these are taken care of. Again, even the evaporation which happens from a pumped hydro plant is roughly 3%, for the water which we store on day one and that 3% is easily catered through the rainfall which you have in the area. So, that, again, is something you don't need. Even for recharging, you don't need a source, which is, say, a river or something else. It is very natural.
Sabri: Right. And another thing is, I mean, I think today or yesterday, I think another project was announced by SJVN in Mizoram. So, there also the input-output efficiency, they have cited 78%, which is also your run rate, I think 76, 77%. So, it is largely established, right, that these plants will run at 75%, 80% sort of efficiency, right, in terms of like the upstream power capacity versus what the pump hydro would produce?
Raj Kumar Jain: You're right. The height of the two water levels is what decides this efficiency. So, but it is broadly economical if it is anywhere between 75% to 80% as an efficiency. You can have lower efficiency, but then the cost becomes higher.
Sabri: Right, sir. Thank you so much for this. And just a small question regarding the SECI tenders that you have won. So, I mean, what could be the minimum CUF that you want to, like, you have to, like, deliver?
Amit Singh: Which tender, sorry?
Sabri: I mean, the SECI, I mean, whatever, I mean, it's also like the tenders which come from like the, suppose, 6 gigawatt or 8 gigawatt that you have in the pipeline. Is there a minimum CUF requirement there?
Raj Kumar Jain: See, generally, the developer, whomsoever wins, has to give the CUF there, subject to a minimum of 19%. And then, so we optimize our plant configuration in a manner whereby economically it is most optimized. So, we have recently guided that our plants in these SECI tenders are going to have around 33% CUF for plants which we are setting up in Khavda.
However, SECI again gives an option, the contract gives an option to the developer to revise the CUF once again within the first year, or in some cases, within the first three years, once you finish the plant. So, from SECI perspective, as long as 19% is achieved, it is fine. But we need to specify a CUF. Suppose we have specified a CUF of 30%, then I need to achieve that with a range of +/- 10%.

Moderator: Thank you. Sabri, I'll request to come back for a follow-up question. The next question is from the line of Ajay Sharma from Maybank. Please go ahead.
Ajay Sharma: Hi. Can I check the 50 gigawatt target which you have? So, what's the total capex you're looking at to implement this?
Amit Singh: If you look at the total capex, which will be in excess of INR 240,000 crores, which includes pumped storage as well. So, it's a big number, which we will continue to optimize and make sure that we get the most out of this thing. If you convert it into US dollars, it's closer to $30 billion.
Ajay Sharma: And do you need to raise any equity by QIP to fund this?
Amit Singh: No, I think as we had explained before, the promoter warrants money is expected and we are tapping into it as we need. So, we have that, already done. The way we have designed the project and the way our cash flows from existing projects work and the new projects will also throw in a lot of free cash flow. So, it will essentially help us make sure that we fund this growth, without any further equity raise or dilution as you asked. Any

thing you want to add, Phuntsok?
Phuntsok Wangyal: No, I think that's it.
Ajay Sharma: And so, what sort of net debt to EBITDA would you target, basically, because this is a big capex? I mean, can you keep your net debt to EBITDA within the covenants, basically?
Amit Singh: Yes. Go ahead, Phuntsok.
Phuntsok Wangyal: Yes, so, you would have seen for my full year, net debt to run rate EBITDA is nearer to 4.0x. And the way my free cash flows will grow, as Amit was talking in the beginning, on the top of 10.9 gigawatt, I will be adding 6 gigawatt. And incrementally, the free cash flow will grow. We don't expect net debt to run-rate EBITDA to be of a level higher than what we have right now.
Amit Singh: And you have to remember that we have long-term debt. So, I think our ability to throw in free cash flow in the early phase of the project is higher than what you might be looking at an average market participant. So, we generate a lot of free cash from our projects, and it will continue to grow because of our operating philosophy when it comes to capital management program.
Ajay Sharma: Okay. Just a last question on the capacity of Khavda, right? So, I mean, 30 gigawatt. So, I mean, do you have customers already in mind, or is this – I mean, is it tied to the PPAs you're expecting? How does it work, basically?
Amit Singh: Yes. So, this year, as I said earlier in the call, a lot of our projects that we're executing this year are under PPAs, which we had won a few years ago. Majority of these PPAs are the manufacturing-linked projects, and we have a very strong counterparty, some in Andhra and some in other states. And we have very attractive pricing and exemptions as well available in this project, where we are able to have exemption from ALMM to start with, which means that we can import modules from outside of India.
These projects also benefit from ISTS waiver. And also, the commissioning timelines for these projects are still ahead of us, so we will also benefit from any pre-COD revenue which will be

generated. So, really, I think our strength is scale and speed, and we will make sure that we bring these projects with a fast track speed, so we maximize the duration of these projects and maximize the pre-COD revenue as well.
Ajay Sharma: I mean, your current execution pipeline is up to 21 gigawatts, I believe. I'm just wondering, so how are you looking at 50 gigawatts? Or, like, I mean, is it based on some future wins, basically? Or, I mean, because it's a large number you're targeting. I'm just wondering.
Amit Singh: Yes, this is the classical way of looking at things, where we only look at PPAs or we look at, you know, things we have won in the tender. Like I said earlier, our approach has now become that we want to target in 2030 a 50 gigawatt capacity, out of which we want to have a 15% of merchant and C&I portfolio. You know, we have been working with lenders and bankers, as you may have seen in our press release.
We have also funded a lot of new capacity into a 60-40 mix, which will allow us to commission these merchant projects, and they're already in the pipeline. And it will allow us to maximize our project establishment on C&I projects or PPAs as need be. We want to make sure that when we look at a resource rich land bank like Khavda, where we have very high solar CUF of 33%, we have a very high CUF of wind, we want to make sure that we use that land resource in the most optimal way.
Ajay Sharma: Excellent. Thank you very much.
Amit Singh: Let me have Raj add a few words as well. Raj, please go ahead.
Raj Kumar Jain: Yes, sure. Thanks, Amit. So, I think the way, as Amit explained, the approach today is to lock in the best sites in the country. When we say best site, it is the cheapest in terms of the execution cost, the best in terms of the resources, the economies of scale which we can drive in, and

the
best technology which we can use and then sweat the assets in a manner which are above the benchmarks and beyond the design. So, that's what Khavda provides to us, and that's what some of the other large-scale sites which we have in Rajasthan provide to us.
Now, the question with respect to how do we tie up – obviously, when I have the cheapest resource available, the opportunity - whether it is supposed to be a PPA, whether it is supposed to be a C&I customer, whether it is supposed to be merchant, whether it is supposed to be mixed in RTC power, FDRE power, hybrid power – all of that is something which is available to us.
As we stand here today, we have close to 10-gigawatt worth of PPAs already signed, which I am supposed to deliver. So, that flexibility is already there with me that I can execute those PPAs if I want to, as PPAs for the next two years, as I mix more and more merchant, C&I, and other types of revenues. That obviously extends it further.
And I will be very selective in my revenue tie-up, which maximizes my revenue. And you have seen our track record, where we have been able to tap in one of the best revenue profiles in the industry. So, we continue on that strategy and we will be delivering that. So, I think the focus is more on, as I said, is to have the best in hand and then actually milk it to the maximum.

Amit Singh: And I think as a reminder, we have 2.5 lakh acres of land, which is – if you look at the resource allocation, it's equivalent of 65+ gigawatt scale already in our access. So, we develop these and we de-risk it through evacuation to make sure that when we develop a project, we don't strand it as well. And we continue to optimize and high-grade our portfolio.
Ajay Sharma: Okay. Yes, that's very clear. Thank you.
Moderator: Thank you. The next question is from the land of Nirav Shah from GeeCee Holding. Please go ahead.
Nirav Shah: Yes. Good afternoon, sir and congratulations on a very strong set of numbers. A couple of questions. So, this was the first quarter of Khavda operations and as you've mentioned that your PLFs there will be 33%. And being first quarter, I mean, it will be meaningfully low because we are just in the phase of stabilization. So, just want to know that what was the broad PLFs in the first quarter, and how much time will we take to reach the optimum level?
Amit Singh: Yes, I think we should not even look at the PLF numbers in the first quarter. I think what we need to do is – you know, Khavda is a place where we are going to be there for the next several years. What we want to do is make sure that we make an operating regime which maximizes our output.
And we have noticed that in one of the blocks where we had commissioned earlier in the quarter, we have already started to see 33% and above PLF. That is one of the subset of the blocks in one of the SPVs. At the holistic level of all the commissioning which had happened by end of March, we are very confident that we will achieve that number, and in certain cases, slightly higher because of a very sophisticated digital approach which we are deploying in Khavda.
For some of you who have been there, you would have seen that we have put together a very modern command center there and we will be managing operations from there and making sure that this is all established. Now, going forward, what you will also see is that the stabilization will also be accelerated because of the work we are doing in this space. So, it is looking very positive there.
Phuntsok Wangyal: And, Nirav, just to be more specific on this, as far as Khavda portfolio is concerned, the CUF which we have seen even during the stabilization phase is nearer to the portfolio CUF which we have achieved. Now, by the end of this quarter which Amit was talking about, once this portfolio is more or less stabilized. At those levels my average

portfolio CUF would have been in excess
of 28%. So, that is the delta which we are talking about which Khavda portfolio will bring as a value addition to the overall portfolio.
Nirav Shah: Yes. Got it. Got it. Second question, you just mentioned in the reply to a previous participant that the contract starting date for the SECI contract is at a later date and we can benefit from infirm sales because we will be commissioning ahead of schedule. So, what is the broad indicative period that we can get to benefit from this advantage?
Phuntsok Wangyal: Yes. I think before Raj gets into that, I will just give you a number on it. You would have seen the operational update, 7,356 million units were generated and you would have seen we have

clearly indicated that there is 1,159 million units which were infirm. That is the value which we are talking about. 15% of the units which we generated in last quarter pertains to projects which

are commissioned ahead of schedule and Raj talked about what is the merchant price realization which we are getting. Raj, now you may add.
Raj Kumar Jain: Yes. Sure. Thanks, Phuntsok. So, I think it depends on the individual PPA but broadly on an average, we should be able to aim anywhere between one and a half to two years of pre-COD power. Again, it is enabled just because we are working in an environment where we have secured connectivity for 30 gigawatts. So, in a lot of these cases, the connectivity which is designated against the PPAs comes with all the elements at a different time than what we have been able to accelerate as to the commissioning of the plant. So, we will have this delta available within our portfolio which will enhance the returns for the projects which we are seeing.
Moderator: Thank you. Nirav, I will request you to come back for a follow-up question. Next question is from the line of Nikhil Nigania from AB Bernstein. Please go ahead.
Nikhil Nigania: Yes. Hi. Thank you for taking my question. My question is just a reclarification firstly on the short-term market sale. So, am I correct to understand 15% of volume sold in the last quarter on the short-term market or was it a higher number and what was the contribution of that in the revenues as well?
Phuntsok Wangyal: Yes. So, if you see out of 7,356 million units, 1,159 pertains to those PPA projects where we commissioned ahead of schedule. Then there is an additional 434 million units actually which were contributing from 550 megawatt of merchant project which we have as a part of our portfolio. So, if you see out of the units which we generated, nearly 21% is from market exposure projects. So, from a revenue perspective the contribution should be near to 30%.
Raj Kumar Jain: I just want to highlight one point here. The good part is the Pre-COD power provides you an option whereby you are able to sell that energy in the market and you can get the significant value kicker for those PPAs. At the same time, in terms of risk, those will fall in under a normal COD project after this COD is achieved for all the transmission elements. So, it is a perfect mix whereby we are able to enhance the revenue from the executed PPAs.
Just adding another point there, so like for 7,000 megawatts out of our manufacturing contract PPAs, for close to 16% we have a perennial merchant exposure in the sense that, despite having a PPA, we have an inbuilt provision to be able to sell that in the merchant market. So, that is an additional kicker in those contracts which add significant value to the company.
Nikhil Nigania: Just for one clarification then, we are able to sell it on the merchant market, the infirm power because the evacuation is not ready at the customer end is that the primary reason or just because we are ahead of schedule or the LD date we are allowed to do that?
Phuntsok Wangyal: No, we are ahead of schedule by a significant mar

gin. So, last year 2,000 megawatt project which we have implemented is ahead of schedule just by contract between 1 to 2 years and at the same time the transmission elements also provide some more flexibility within that time period.

Nikhil Nigania: Understood, got it, thank you. My second question then is just, I am not sure if I read it correct in the notes the convertible debenture from Total Energies, I think which was invested quite some time back. Has there been any change in that debenture per se the fixed coupon debenture which Total had invested some time back?
Phuntsok Wangyal: No, actually I think this you may be referring to Q3 event where when we set up this new platform with TotalEnergies as a part of that platform, the stapled instruments which we had in the past were converted into compulsory convertible debentures. The stapled instruments for accounting purpose were getting treated as debt instruments. Just to make it absolutely clear, because the intent between both the partners was very clear that stapled instruments were nothing but equity instruments. For accounting purpose, to have that clarity those stapled instruments were converted into CCDs. But that was a Q3 last financial year event. Nothing has happened post that.
Nikhil Nigania: Okay, probably missed that. But the coupon, do we still give the coupon on that, I think the 12%-13% coupon?
Phuntsok Wangyal: No, we don't give it actually. Since, as I said even under the intention of staple was to assume it should be treated as equity. So, from CCD perspective there is no obligation to pay the coupon.
Nikhil Nigania: Okay, understood. And even the JV investment which TotalEnergies has done that is a debenture, am I correct to understand that? The JV investment which came in last year?
Phuntsok Wangyal: Absolutely, it is exactly in the form of CCD. Now there is absolute clarity that risk reward should be shared equally between the partners or to the extent of their shareholding and your accounting treatment should also reflect that.
Moderator: Thank you Nikhil, kindly join the queue for a follow-up question. Next question is from the line of Sumit Kishore from Axis Capital, please go ahead.
Sumit Kishore: Good afternoon, a couple of questions.
Moderator: Sumit, sorry to interrupt you, can you speak through the handset please?

Sumit Kishore: Yes, is this better?
Moderator: Yes, thank you.
Sumit Kishore: Yes, of the 6 gigawatt capacity that will get added through FY '25, just want to understand at the end of the fiscal what proportion of the total installed capacity would end up being merchant plus C&I and maybe even two years out if you could sort of give us a sense of what proportion would you be keeping in merchant plus C&I? The second question would be on the roadmap going forward for carbon markets and what role Adani Green would have there and how would that be adding to your cash flow stream?
Amit Singh: Yes, let me ask Raj to answer the first one and I will comment on the second one, so go ahead Raj.

Raj Kumar Jain: So out of the 6 which we are adding, close to 1,800 odd megawatt would be merchant, which is predominantly wind, so 1,000 megawatt out of that is wind, out of which 250 we have already done. Then on a mixed basis already we have some 550 megawatt operational merchant, again that is predominantly wind, 350 megawatt out of that is wind and 200 megawatt solar. So from a split perspective we are talking about close to 1,400 odd megawatt of wind and balance being solar out of roughly 2,400 megawatt merchant in total by end of this year and this is out of a capacity of roughly 17 gigawatt.
Amit Singh: So I think on the second thing you asked, look I think the carbon CBAM rules are now in practice in Europe and if you look at some of the policy updates

which are coming from the government,
they are also looking to update some kind of a carbon mechanism in India and there is a lot of incentive being put together for industries who are hard to abate sectors or high power consumers or energy consumers to decarbonize themselves and what that does is that drives a lot of growth for C&I discussions, C&I transactions and not only classical industries like steel and cement but also, you probably know the trend in AI and a lot of data centers which are opening up in India are also looking to have a long-term supply of green electrons.
So, we as a renewable energy provider and also combining it with pumped storage and where needed battery systems, we can produce a very high CUF and very high firm dispatch power for our customers and that directly benefits in terms of locking in this premium pricing. Now also a lot of our projects today are registered under the Gold Standard and Verra which were commissioned a few years ago and also we continue to look at the current and new carbon UNFCCC regime where we register these projects and we also benefit from carbon credit sales as well. And the third dimension is the RECs which are generated when we do a Green or a DAM market sale and these RECs also get transacted and customers acquire them and we have bilateral discussions where they want to decarbonize and achieve their own net zero goals.
All of this is underpinned by a very strong enforcement by the government on the carbon efficiency program, the RPO obligations of DISCOMs in states and a lot of other things which are being driven in response to the climate action.
Sumit Kishore: What would be your current backlog of RECs that is unsold?
Amit Singh: I think these numbers we won't be able to share openly but we have put together and we have some signed up with customers at attractive pricing over long term and I think the other thing you will know is that the BEE has enforced RPO obligations and there are quite strong penal actions if you don't meet them by end of the FY25. So we are also expecting that some of the RECs and REC unit price will continue to rise as we get closer to that date and beyond.
Sumit Kishore: Thank you so much for answering my question.
Moderator: Thank you. Next question is from the line of Dhruv Muchhal from HDFC Asset Management. Please go ahead.
Dhruv Muchhal: Yes, thank you. Probably a question to Raj, response earlier. So you mentioned 1,800 MW would be merchant of which 1,000 would be wind. So 800 MW merchant solar of the total 5,000 MW that you are planning to commission this year. But this 800 is pure-pure merchant. There would

be also the pre-commissioning, the pre-COD projects that would be there right? Or this captures everything. 800 captures the merchant plus the pre-commissioning ones.
Raj Kumar Jain: No. So the entire capacity which we have, which we are commissioning this year, will have that pre-commissioning opportunity in terms of being able to realize through multiple means. So we obviously continue to place power in a manner where we maximize the revenue but in the entire capacity which we are commissioning this year, nearly for all I will have the pre-commissioning

power.
Phuntsok Wangyal: And Dhruv, I think as a part of portfolio we have given a guidance that 15% of my portfolio will be merchant. And if you see by the end of this financial year, we are talking about 17,000 MW.
And if you take 15% of that, that is 2,550, if you do a math this will make it absolutely clear.
Right now, we had 550 MW of, we ended with 550 MW of operational merchant project in last financial year. I commissioned 250 MW the day before yesterday which is a part of 1,800 MW which Raj was talking about.
Dhruv Muchhal: Sure. And just on the strategy of, probably just to get it better. So I understand the benefit of wind merchant but just try

ing to understand the solar merchant better. So even in the peak times, the summer times, we saw that merchant tariffs at least on the exchanges were about INR 2.5 or INR 3? And probably, assuming that India commissions about 25 GW, 30 GW or even higher, at least the government is targeting capacities of solar. Probably the merchant prices will fall even further during that time when the solar is generating. So how do you maximize benefit from this merchant sales of solar power?
Amit Singh: Let me maybe explain to you the context a little bit. See, a lot of, the ISTS waivers will come into play from June 2025. And ISTS cost, if you look at a peer-to-peer comparison of an electron being generated in let's say Khavda, in one of these merchant projects, and you compare that electron in, for sake of discussion, Bihar or Northeast India, there is at least a INR 1 plus difference or delta.
So this by itself kind of gives a tailwind support on our merchant contracts for the duration of the project. Second, I think when we look at, like I explained to you, we have a very good pipeline of C&I deals which we are working on, which will not only require wind, but will require different combinations of solar as well for daytime.
And our customers are looking at, some kind of a firm power with very high CUF. So we will combine some of this solar power and make sure that we deliver on those contracts. So like you also talked about, I think when you look at just in the slice of time in the daytime, the pricing is weak.
But when you look at over a long period of time, when you're combining it with other things like the pumped storage, we also are de-risking ourselves by opening up an arbitrage between daytime price and evening price. So as you know that in 2030 we are projecting around 11% of our capacity with pumped storage, which means that we will have 5.5 plus gigawatt of pumped storage capacity.

And, we will be able to convert the solar MUs into evening as well. So we have de-risked our portfolio, making sure that, we have a good mix between solar and wind and pumped storage. And we are able to then monetize as per the demand of the grid, the customers, and the PPAs, which we have line of sight on.
Dhruv Muchhal: Interesting. Thank you. That's helpful. Thanks a lot.
Moderator: Thank you. Next follow-up question is from line of Ketan Jain from Avendus Spark. Please go ahead.
Ketan Jain: Thank you, sir. My question is on the pumped storage thing. You mentioned the capex for us is around INR 4 crores to INR 5 crores per megawatt. I just want to understand some of the peers have the capex around INR 8 crores to INR 10 crores. What makes it lesser for us? Is it the site? Is it because of the site location? And can you give me the split between the civil and equipment of the INR 5 crores capex? And also, are we doing the EPC on our own or is it outsourced?
Raj Kumar Jain: Yes. So I think two, three points. What we understand the industry benchmark is anywhere between INR 5.5 crores to INR 6 crores per megawatt. I cannot talk about where this 8 is. If there is someone who is doing at 8, needs to relook at that. Number two, in terms of the breakup, it depends on the site, but anywhere between – the ratio moves between 45% to 55% between the civil and the equipment.
But again, as I said, it depends on site to site, depending upon whether you need to have both sides civil work or only one of the sites and the other side is more enhancements. Number – what was the last question?
Ketan Jain: EPC. Are we doing it on our own?
Raj Kumar Jain: Yes. So we have divided the work into multiple contracts, whether it is equipment supply contracts. So for Chitravati, the equipment is coming from one supplier. The civil part, again, has been divided into more than one contract and that is being done that way. Obviously, as a group, we do

our own management and assurance.
So that is the way it is happening, but it is something which we evolve as we move in the sector

and I think as we move further into some of these future projects, we will be able to have more
packages to have more control over the time, quality and the cost for these projects.
Ketan Jain: And the equipment is localized or is it imported?
Raj Kumar Jain: I think I can come back to you on that. The supplier is not from India.
Amit Singh: Yes, we won't be able to openly discuss it. I think we are still finalizing some of these things for our ongoing projects, but I think, yes.
Ketan Jain: Sir, my last question is on the recent import duty on solar glass, which the government has put. Is this going to impact us? Where are we importing the solar glass or are we going to again now procure it locally?

Amit Singh: No, look, I think we are not in manufacturing and I think some of these changes will be reflected in the pricing, but long term, we are expecting the price of module and cell to come down. And as you know that quite a few of our PPAs benefit from – we can import from outside India, so we have that option, available to us in several of the projects over the next year or two.
So we are not directly impacted by this change in – which was announced a couple of days ago.
But listen, I think in India we need a domestic supply chain. We need to localize the economy, so we very much support the move which has happened. And we are very confident that over a period of time, this is only going to reduce the cost and bring down our capex cost as well over a long period of time.
Ketan Jain: Thank you and all the best.
Moderator: Thank you. Next follow-up question is from the line of Ajay Sharma from Maybank. Please go ahead.
Ajay Sharma: Yes. Can I check what sort of tariff are you expecting for the pumped storage projects?
Amit Singh: I think pumped storage projects, as I explained earlier, I think we are not looking at purely just putting the pumped storage on a long-term contract only. We will have a combination of approaches. We will – for example, a baseline, if you look at, is around INR 3.8 to 4.5 plus (per unit) when you look at what's happening in the market.
But our approach is going to be to combine it with solar and wind and also use it for the C&I projects, which we are working on, where, again, the pricing, which you will realize, is going to be higher when we combine for the customers. Now, I think if you look at our mix of 5.5 GW, we will make sure that close to 60 - 70% is on long-term agreements, and we will look to see if we can create an opportunity for us to maximize returns for the rest of that capacity.
But we will give more color on this as time goes by. I think right now we are focused on executing these projects, making sure that we have this capacity available to us. We are not in a rush to tie up. We have already secured financing, so we are not necessarily looking to put these projects on any kind of low-cost regime as well. So it's going to become our upside opportunity in this decade. I think we've kind of run out of time as well, so absolutely great discussion today.
And it will be – maybe pass it back to Viral.
Viral Raval: Thanks a lot, everyone, for joining this call today. We'll be happy to connect in person with you if you have any further questions. Thank you all. Thank you, Mohit and ICICI Securities team, for arranging this call. Thanks a lot. Bye.
Moderator: Thank you very much. On behalf of ICICI Securities Limited, that concludes this conference.
Thank you for joining us, and you may now disconnect your lines. Thank you.

Dear Sir,

Sub: Transcript of Earnings Call pertaining to the Unaudited Financial Results
for the quarter and nine months ended December 31, 2024

With reference to above, we hereby inform below link of transcript of the
Earnings Call on Unaudited Financial Results (Standalone and Consolidated) of
the Company for the quarter and nine months ended December 31, 2024 held
on January 24, 2025.

Web link to access above transcript is: https://www.adanigreenenergy.com/-
/media/Project/GreenEnergy/Investor-Downloads/Results-Conference-Call-
Transcript/AGEL---9M-FY25-Equity-Earnings-call-transcript.pdf

Kindly take the above on your records.

Thanking You

Yours Faithfully,
For, Adani Green Energy Limited

Pragnesh Darji

MR.VIRAL RAVALHEAD OFINVESTOR RELATIONS
MODERATOR : MR.HARSH MARU EMKAYGLOBAL FINANCIAL
SERVICES

Moderator: Ladies and gentlemen, good day, and welcome to Adani Green Energy Limited 9 Months FY

'25 Results Conference Call, hosted by Emkay Global Financial Services. As a reminder, all participant lines will be in the listen-only mode and there will be an opportunity for you to ask questions after the presentation concludes. Should you need assistance during the conference call, please signal an operator by pressing star then zero on your touchtone phone.
I now hand the conference over to Mr. Harsh Maru from Emkay Global Financial Services. Thank you, and over to you, Harsh sir.
Harsh Maru: Thank you, Manav. On behalf of Emkay Global Financial Services, I welcome you all to the 9 months FY '25 earnings conference call of Adani Green Limited. I would now like to hand the conference over to Mr. Viral Raval who heads Investor Relations at Adani Green. Over to you, sir. Thank you.
Viral Raval: Thank you, Harsh. Good afternoon, all. And thank you very much for joining the conference call today. I hope you would have had the chance to go through our earnings presentation. With me, I have Mr. Amit Singh, CEO of the company; Mr. Saurabh Shah, CFO; Mr. Raj Kumar Jain, Head of Business Development; and Mr. Anupam Misra, Head of Corporate Finance for the group.
We also have with us Mr. Ashish Khanna, who will be taking charge as the CEO of the company effective April this year. He will primarily be a listener for this call. Just to explain the flow of the call, we will begin with an opening statement from our CEO, followed by Q&A, and then closing remarks.
Let me now hand over the call to Amit for his opening remarks. Over to you, Amit.
Amit Singh: Good afternoon, everyone. Let me start with giving a bit of an overview on our results, and then we'll take the questions. I'm really pleased to report that we have delivered another quarter of outstanding operational and financial performance.
Firstly, I would like to highlight that AGEL contributed to 15% of nationwide new solar capacity and 12% of new wind installations in the year 2024, a remarkable achievement which truly underscores our leadership in the renewable energy sector. Our energy sales has also increased by 23% year-on-year to 20 billion units for the first nine months ending December 31st.
And our revenue from power supply has seen a robust increase of 18% year-on-year, reaching INR6,829 crores. This growth is a testament to our relentless focus on project execution and operational excellence across all our sites. Similarly, our EBITDA from power supply has increased by 18% year-on-year to INR6,366 crores, while our cash profit has surged by a substantial 23% year-on-year to INR3,630 crores.
On a year-on-year basis, we've added 3.1 gigawatt of greenfield capacity, marking a massive 37% growth and bringing our total operational portfolio to 11.6 gigawatt, the largest footprint in the country.

I would like to take a minute and talk about our flagship project in Khavda, which is progressing very smoothly while we are developing the world's largest renewable energy plant. And to ensure we continue to ramp up our execution capability, we have focused on three key pillars in which we are seeing good progress. First, we are making sure that we continue to closely align our project execution with transmission readiness and making sure that our forward plans also incorporate it. Second, we are extending our relationships with suppliers, not only internationally for solar modules, but also domestically as ALMM compliance and ALCM compliance comes into play. And thirdly, we are extending our workforce footprint in Khavda to north of 12,000 people, which is the biggest footprint we've had and it's growing for a very sustained and faster execution of both solar and wind projects over the coming ye

ars.
Furthermore, with our rapid progress we have in Rajasthan and Khavda, as I just described, we are well on our way to deliver a significant new capacity in the final quarter of the current fiscal year. This is set to establish a global benchmark for speed and scale of execution for ultra-large scale renewable projects in the world.
Now, in terms of new business development, we have made notable progress in expanding our PPA pipelines. This includes our recent success in the tenders floated by NHPC, UP, and NTPC, which you may have already noticed.
We remain committed to delivering above market return expectations while staying aligned with our long-term strategic objectives of 50 gigawatt by 2030. We aim to have 85% of our contracts to be long-term fixed-term PPAs, which will provide stability of cash flows, while we will have approximately 15% of our capacity around C&I and merchant, which is expected to enhance our portfolio returns.
We have also now updated our strategy to include large-scale deployment of battery energy storage solutions. Given the significant cost declines we have seen in the last few quarters, BESS will be a crucial solution for grid integration, supporting rapid renewable growth, and

complements our existing solar, wind, and hydro pump storage projects in the portfolio.
Lastly, our focus on digitalization, robust capital management, and best-in-class governance continues to drive our progress in AGEL. Our digital initiatives includes implementing advanced analytics to optimize performance, automation across the value chain, and use AI for decision-making to optimize project development, operations, human resources, and safety across our sites.
Our commitment to strong governance standards stays unwavering. We rank among the top in ESG rankings, reflecting our dedication to environment, sustainability, social responsibility, and a transparent governance practice. Thank you for your continued support, and maybe we can now open for Q&A.
Moderator: Thank you very much. We will now begin the question-and-answer session. We have our first question from the line of Anuj Upadhyay from Investec.
Anuj Upadhyay: Sir, can you throw some light on your capacity addition target for this year and next year? And also, as you mentioned, there is a change in strategy to focus more on the battery storage aspect.

So, it could be, I mean, whether it's a battery or a PSP. Any further statement or discussion on that would be helpful, sir? Would it be through participation more on the FDRE tenders or exactly the entire system?
Amit Singh: Sure. So, I'll take it one by one. So I think to answer your first question on our estimated new capacity, which we are targeting to add, look, I think there are -- before I give the number, which I know you are all anticipating to hear, let me give you a bit of a background.
I mean, this year, we had extended monsoon. And this extended monsoon typically hampers projects in Khavda in a different way than in other places because of some water logging, which was above what was anticipated. And the intensity of that rainfall was quite high towards the end of the monsoon season. So there is a small shift to the right on the S-curve of our construction program in Khavda.
At the same time, we have seen good progress on other sites, in other places where we did not have this issue as severe as what we had in Khavda. So when we look at totality, and also there were some regulatory changes, which were introduced in December around trial run and certification program for renewable sector.
So when we take it into totality, we feel very strongly that we should be able to deliver approximately 5 gigawatt of new capacity this year. So this will mean that we will have an incremental capacity of 4.3 gigawatt, which should come out this quarter, by end of this fiscal year. And we have, like I explained to you, a good footprint of resources and manpower already in our project sites, which is working very hard to deliver on those goals.
And the remaining capacity, which we had talked about earlier, will be also ready from a civil and electrical point of view. But we anticipate that shortly after, four to five weeks after, we should be able to announce commissioning in early part of Q1 for the remaining target we had given you for this year as well. So, yes, just to kind of repeat, I think we are expecting to close the year with 5 gigawatt of new capacity this year.
And the remaining 1 gigawatt plus/minus we talked about for this year will shift to the right and we're expecting to complete in four to five weeks after the close of this year, because of where we are in our construction and the progress is really, really amazing right now in all our sites.
Now, we are also making sure that while we are preparing to deliver these new capacities for this year, we are targeting a very strong next year as well. And our ramp up for that as well has started and we've started making sure that all the early planning, material ordering, engineering design is in flight already.
And we will make sure that we increase our run rate from this year to next year by a significant amount and some of these numbers we will discuss as we go. So I think that would be for next year. But I think when we come to the close of the year, we can give you a better picture on where we are for the next financial year.
Now to answer your second question on batteries and how do we look at it. So, look, I think the battery prices and costs have come down quite significantly as I think everybody on the call

understands it very well. And when you look at it together combined with solar or combined with any grid input power, the net impact is really, really impressive. So we see a long-term trend of battery installations growing in India and we want to make sure that we take a leadership

position in that.
You know, like we have done always, we will make sure that we approach this space keeping in mind that we maximize returns. We make sure that we have stable and predictable cash flows. So we will, obviously, use battery solutions primarily for RTC power demand. We will look at tying up with C&I customers. We talked about earlier we have a lot of data-centric companies are working with us.
We announced earlier in the year about Google, but we are talking to several others. And we feel that there will be a much better port of call for the initial deployment instead of tenders. But we will also participate in tenders. Like, again, you may have seen yesterday in NHPC, we won some capacity. So we will selectively also participate in tenders where battery solutions are required and we will make sure that we attack that space very aggressively. Does that answer your question?
Anuj Upadhyay: Yes. Just one thing, sir, is battery storage which we will be participating in will be for our self-consumption, whether it's data center, RTC, or FDRE. We are not working on a model where we will be providing a storage facility for any third party, which many of your other peers are working on. Am I right, sir, in this assumption?
Amit Singh: Yes. I think we have -- as you know, we offer all kinds of renewable solutions; solar, wind, hybrid, pump storage. We don't have to have a vanilla approach towards storage. We have the engineering capability and footprint available to us to combine it with other sources of renewable power and offer a complete end-to-end solution. And when we talk to our customers, they're looking for end-to-end solutions. So, given our capability and leadership in the market, we feel that is an area we would like to operate in, and that will be our primary focus.
Anuj Upadhyay: Great, sir. And lastly, sir, on the PPA with

the data centers or the other segments fall under the
C&I category, right, which we are targeting to have closer to around 10% of our total portfolio, like 85% long-term PPA, 10% C&I, and 5% merchant. Am I right, sir, in this aggregation?
Amit Singh: Yes, I think, look, we look at merchant and C&I interchangeably because some of these capacities can be tied up for bilateral agreements for a short period of time where it is value accretive. And as pricing evolves, we will even look to settle these merchant contracts on long-term PPAs in the future.
We are very closely monitoring the growth in the country, the power demand growth, and also we are very aware of what other companies and developers are making progress. So we see a gap emerging between demand and supply, and we want to be ready to service that gap, and we will take that call at the right time.
Moderator: We have our next question from the line of Darshan Parmar from Jefferies.

Darshan Parmar: I just wanted to get a sense on the reduction in finance cost and also the deferred tax number, if you could give us a sense on that?
Amit Singh: Sure. I think, look, you probably were aware that we had Holdco bond, which we have repaid, and there was a large interest expense, which obviously is not in our books anymore. So that is contributing significantly to the drop in interest charges for the current quarter.
This also combines with some favorable refinance we had of some of our projects. So overall, there is a slight decrease in interest charges as well. And when it comes to taxes, I think some of the distribution, TotalEnergies distribution, also benefits from deductions. And hence, that is now reflected in the tax bracket as well. Saurabh, I don't know if you want to add to this. I know you're on the call.
Saurabh Shah: Yes. So in terms of interest cost, as Amit said, that it is more about the Holdco repayment, plus there were other refinancing and various NCD conversions of TotalEnergies. Plus on the tax side, again, we get deduction on the distribution that we give to TotalEnergies now. So therefore, there is a reduction in the overall tax bracket.
Darshan Parmar: This is a one-off, right? So what can we accept as a sustainable tax rate going forward?
Saurabh Shah: See, from our perspective, every six monthly basis, there will be a distribution which will continue. So it will be there as an overall thing. But with our profits growing year-on-year, yes, the tax over a period will again keep on adding up. But yes, right now, every six months, we have a distribution. So that will keep on happening as a tax deduction.
Darshan Parmar: And what is the normalized interest cost which we can expect?
Saurabh Shah: So normalized interest cost would be in the range of 9.0% to 9.4% as of now for the current portfolio.
Moderator: The next question is from the line of Nikhil Nigania from Bernstein.
Nikhil Nigania: My first question is on the commissioning plan for this year of 5 gigawatt. If you could give us some color, is this all against the manufacturing linked PPA? Is this merchant? What is the nature of this capacity? Because there was a plan to push merchant capacity this year in anticipation of

transmission charges getting implemented from July 25th.
Amit Singh: Yes. Absolutely. Look, I think when it comes to solar and wind split, I think we're targeting 85% of capacity on solar and 15% on wind. And when it comes to PPAs, I think out of the solar, 75% of which will be on PPA, and the remaining will be on merchant.
As you know, the ISTS waiver, it's applicable until June. So we're also in flight on some projects which we plan to commission in the first quarter of the year to take advantage of that as well.
But that's the split we have. When it comes to wind, all of it is merchant. So 100% of the capacity we are putting together in wind this year and

likely next year also will be on merchant.
Nikhil Nigania: Got it. Understood. And the PPA part you mentioned would be for the manufacturing linked PPA, because that was majority of the pipeline, as we understand.

Amit Singh: Yes. So a good part of it is that, and I think there are some other projects we're working on. But a good part of that is around that. And as you know, the timelines of that project is also in the future. And there not all the connectivity is ready. So what we will do is make sure that we put these projects together.
And this in the early phase, we are able to supply where we get permission on the grid and supply power to the grid as well. So, yes.
Nikhil Nigania: A related question then on the grid side. So the headwinds we are seeing for renewable broadly, one is, as you said, the grid connectivity for the broader renewable space. Second is restrictions on solar cell imports coming in next year. And third is reluctance on DISCOM s to sign PPAs, given the big backlog that has been created.
What would be your thoughts on these aspects? And are you facing similar challenges as well?
Amit Singh: Yes. No, all three are valid points. I think the first one is on transmission. So I think the transmission delays are very, very visible in some of the areas. And obviously that has shifted many of the projects to the right. We're working very closely with all the key stakeholders in CTU and PGCIL and our own sister companies to make sure that we first understand what those delays are like.
And where possible, we can coordinate with them to align. So that is absolutely something which is the top priority for the government as well. And in many of the public meetings we have raised this. And they are really, really looking at accelerating this and fast-tracking it. But in parallel, I think batteries have come in a good time.
I think combining battery and supplying power when the transmission capacity is not used fully and adding more wind as part of our portfolio is a way to de-risk transmission, tardiness, if you want to call it. So that will be pretty much our approach towards this. But having said that, we have made sure on that in our numbers, which we have shared with you.
And we are very well aligned with transmission readiness we see on the ground. For example, in Khavda, we have very clear protection for the next three years of what transmission progress is, the status. And we are very comfortable that the system will be ready in time for our commissioning.
Because it's a large commissioning we're doing there, so we have to be very careful with that. And the same applies in Rajasthan. So we have that advantage. And all the numbers we have shared with you today are linked to that readiness.
The second question you asked is the impact of ALMM and ALCM. So look, I think all the current bids we have had did not have ALCM. But it's going to help grow localization, and we are very favourably looking at this. It is important for the country to be self-sufficient and have the ability to produce cells and go from there. So we are looking at it very favourably.
So we expect that in the beginning there will be a small increase in the cost of these by 2-3 cents from a purchase point of view. But it will then again come down and stabilize as the country

manufacturing capacity picks up and so on. The way we are de-risking it from AGEL point of view is making sure that we build existing and good relationships not only with our sister company but also with other suppliers in the country. So today, like I told you in my opening remarks, we have those long-term relationships where we have tied up some capacity for our supply chain at a very favourable price. And we will be able to benefit from that over the next cycle and give above portfolio

returns and above market returns as well.
What is the third thing, Nikhil, you asked?
Nikhil Nigania: DISCOM are reluctant to sign PPAs.
Amit Singh: Yes, DISCOM s, you're right. I think what has happened is that the DISCOM s are getting, you know, a lot of PPAs have been signed and a lot of DISCOM s have been doing their own tenders.
And you also see that we have also slightly shifted our strategy and started participating in DISCOM tenders. And a good example of that was how we looked at Maharashtra and UP as well. And we are making sure that there we don't have these risks and we are also able to get good pricing and a good framework with them. So Maharashtra, we have 5 gigawatt and similarly in UP as well we have a good capacity added to our portfolio.
We believe that some of these things will get tied up as RPO obligation comes into force by end of this year. MNRE is driving and Burau of Energy Efficiency is driving that very well. And we believe that DISCOM s will have a good incentive to sign up on these as those RPO obligations come into force more aggressively.
Nikhil Nigania: Given all these factors, would you still, I mean, keep the guidance same for next year as well, 6 to 8 gigawatts commissioning in that range or should we trim it down in our expectations?
Amit Singh: No, we'll keep it the same. I think the range is still the same and we are looking to ramp up our existing run rate and not reduce it here.
Nikhil Nigania: Perfect. That's helpful. A third question, if I may ask, is in terms of strategy. So two events are happening. One, as you mentioned earlier in the call as well, battery prices have fallen sharply and second, transmission charges now becoming applicable. These two events, are they driving any change in strategy from Adani Green's perspective?
For example, on pumped storage, lesser optimism on that and second, even in terms of being as it's considered in Khavda towards developments in states as transmission charges come in?
Amit Singh: Yes, look, I think the first thing is that if you look at battery prices, I mean, they're still, if you look at on a LCOE basis, they're still when you compare green LCOE, not gray, they're still far away. So PSP itself, when you look at a green solution, when you're looking at matching an hourly availability or supply of green power to some of our customers, they're looking for hourly matching. That is most likely possible at scale with PSPs. And also remember that voltage regulation and voltage management is also important. So I think when you look at the strategy of the country and we closely mirror that in AGEL, PSPs will have a big role to play.

Because electronic equipment like inverter and batteries don't provide that support. So I think, in the whole mix, PSPs will play a role and we will definitely support the grid to make sure that we play that support role there. Now, when it comes to GNA charges and how that is evolving, I think the co-located batteries will become very common going forward.
We believe that battery solutions will be there in conjunction with renewable power. And this is very visible in the way the current tenders are being laid out in the market. And we feel that will continue to happen and GNA charges will adjust around that. There will also be acceleration of new renewable products because of that as well.
Nikhil Nigania: Understood. Thank you. One last question I had. This was on the financial statement. This is regarding non-controlling interest. That has been quite volatile, which was up sharply last quarter and is a negative number this quarter, which seems surprising given it was mostly on operational assets. So if some color could be shed on that?
Amit Singh: So this number, I think, is an accounting adjustment. The distribution policy and the commercial arrangement with our partner and this was kind of put in place

and it is now stated there. Maybe
Saurabh, if you want to give a color on that.
Saurabh Shah: So as I just mentioned that because of the distribution kicking in for the TotalEnergies payments and because of that, on the NCI, we had to completely do reworking and therefore there is this one-off thing. After this, just based on the distribution, whatever be the tax it will be constantly paid because the distribution is allowed as a tax deductible.
Nikhil Nigania: No, I didn't mean from tax perspective. I mean the part itself, the non-controlling itself.
Saurabh Shah: The reason is that distribution because of which the overall NCI working was changed and because of NCD conversion to CCD, there is a control change which has happened.
Moderator: We have our next question from the line of Bharani from Avendus Spark.
Bharani: So my first question is on the battery storage aspect. Now, we have seen a little bit of irrational depending on the standalone battery tenders and there are a lot of new names. So if I were to put it bluntly, probably even non-serious names. Given that fact and irrationality, how do you see the storage costs that are getting discovered in these tenders sustaining?
And won't this become a challenge for the overall storage cost, which is right now at around INR4 per unit from battery say incrementally or increasingly higher in the future, thus decreasing the attractiveness of this battery dream?

Amit Singh: No, I think you're right. I think there has been a lot of very aggressive competitive behavior in these tenders and I think we have stayed out of it as well. We're not interested in, first of all, in these vanilla projects. And secondly, we're not interested in taking these kind of funds in the market.
We are very carefully working with the big suppliers of battery systems in the world. And we are aware of the trends and technology progress and improvement. And like I said earlier, we

are going to be careful with that and make sure that we de-risk our solution and technology before we jump into it in a big way.
So we have made a lot of progress over the last six to nine months. And we continue to look at projects differently than the market to make sure that we don't take unnecessary supply chain risk. So definitely we will not participate in that fashion. What that does to the market, I think time will show.
Our feeling also is that battery prices will continue to step down as technology improves, the number of cycles grow, LCOE will come down. Some of these bets people are making, they might work, some of them may not work. But we're not in that business. We take calculated risks and we want to be assured of our returns.
So we will not be, yes, we'll not be affected by that.
Bharani: Since you are working in this closely and I think there is a lack of understanding in the market regarding this, or I would say at least a lack of in-depth understanding. So can you just refresh a little bit on what would be the rational cycle, a cycle one should assume for a typical battery or even a life of a battery or those kinds of things?
And what kind of supply chain risks are there, which one should avoid a little bit on this particular industry?
Amit Singh: Yes, I think if you look at, some kind of analysis we've done, we see that when you look at capex, we should look at capex of INR1.3 to INR1.4 crores per megawatt hour and cycles remain between 8,000 to 10,000 cycles, which means that you can expect the battery to last for 16 plus years and degradation can be factored between 1.5% to 3%.
So, I think these chemistries and technologies are evolving very, very quickly and each technology and their pricing also varies quite significantly. So the design of these battery systems, the LCOE varies quite significantly between project to project. It will not be as straightforward as you would probably be mode

lling in solar modules.
So I would hesitate from commenting any further, but those are the kind of assumptions I would use for the moment here.
Bharani: So it was not clear when you mentioned what would be the capex cost for kilowatt hours, sorry?
Amit Singh: Yes, we typically would expect between INR1.3 to INR1.4 crores per megawatt hour.
Bharani: My second question is on looking at your strategy to install capacities to take advantage of the merchant market. So if I were to just look at the one data I was looking at, there is this Renewable Energy Certificate Registry at the end in which you need to register to get certificate. I see one of Adani Green wind projects registered there.
So in your pecking order, where is the attractiveness in the pricing right now? So is it in the merchant market, especially in the evening hours or is it in the registry market to take advantage

of the Renewable Energy Certificate? And what is the future of this? Like you also mentioned you're closely monitoring the demand-supply situation in the country.
In your assessment, is this merchant prices and these sorts of markets going to be attractive because there is a recent slowdown in power demand and prices have come down, and then hence this question?
Amit Singh: Yes. Sorry, there's a lot of noise. I'm just trying to follow your question. If I understand your question, you're trying to understand where the gap is between day and night prices and how that will be in the next few years. I think the evening power has continued to be huge and the big power demand in India is only growing. So definitely that will stay the course. You also recognize that the day power prices, if you look at the merchant price, has come down on year-to-year. So the delta or the gap has kind of stayed where it was or maybe it has even grown in some cases. We expect that to continue to be the case as the demand has shifted to solar hours for the agriculture. And maybe in the future when smart metering is established well, there will be bigger demand in solar hours. So the gap will always be there. And we believe that gap will

become a key way to play and use battery solutions with merchant, and that could be one angle
we will look at. But we'll also look at other angles of supplying RTC power solutions to our
customers where that is needed.
So there are different avenues of how we will monetize, but you're right. I think that will always
play a big role where we can essentially time shift the power towards peak pricing. RTCs will
play a role, but we feel that it has been priced in the market already, and that kind of factors into
our discussion.
But the big role will be the delta, which we talked about earlier.
Moderator: We have our next question from the line of Love Sharma from JP Morgan.
Love Sharma: Wanted to just check, since the November indictment of some of the executives, what did you
get a sense on the funding side? What's been the trend which you've seen so far from domestic
lenders and international lenders, if any major drawdowns which you would highlight, for
example?
And secondly, about the construction facility, I think about the billion-dollar deal in March, what
would be the basic scenario here for refinancing of that facility?
Amit Singh: Yes, thank you. You know, as we have stated in our disclosures earlier, I would like to restate
that AGEL is not a party to the litigation. It is against the three individuals, as stated earlier, and
this was already clarified. As a group, as a company, Adani Group has always upheld and is
committed to maintaining higher standards of governance, transparency, and regulatory
compliance across all jurisdictions and operations. And that is very well recognized by the
financial institutions as well. So currently, in fact, when the incident evolved, we already had 12
plus months of financing, and thos

e disbursements have very smoothly continued, so we don't
have any gap of disbursement or financing.

And we are getting very good interest from all the domestic lenders on even new projects which
we are looking to finance. And we are making very good progress there. So I think from
financing both existing pool of projects and new pool of projects, we feel to be very well set.
On the refinancing of the project, which is due in the end of this quarter, we are in a very
advanced stage of discussion with one of the domestic lenders, and we should be able to
announce its completion in the next few weeks. And that would be the end of it. And also, don't
forget, we have a very good facility, the Emerald facility of $3.4 billion, which the Emerald 1,
which is the refinance the part you talked about. When it exits, we will have a gap there, and
that will also help service new projects which we are planning.
So we are very well set with our existing capital management program and the framework we
put in place, is making sure that we have a very resilient supply of capital to fund our ambition.
Love Sharma: Great. Thanks, Amit, for that. So just to clarify, I mean, in terms of any changes from lenders'
perspective, any interest costs change or any terms which have been changed from their
perspective? I believe there is none of that, right?
Amit Singh: No, there is no change. I think the domestic lenders are more excited to work with us. They will
have more opportunity. They're looking to work with us, so, no.
Moderator: We have our next question from the line of Aditya Sahu from HDFC Securities. Mr. Aditya.
We'll move on to the next participant. The next question is from the line of Guixin Lin from
BNP Paribas.
Guixin Lin: My first question is on the short-term debt. Is there any backup plan if this financing plan with
the domestic bank cannot conclude in time?
Amit Singh: No, I think... First of all, I think we're very confident with this plan. I think this is already going
ahead. We are in a very advanced stage of completion. So we have backup plans, but I think the
primary plan I just mentioned is already very advanced and we should be able to conclude.
Saurabh, you want to add to that?
Saurabh Shah: No. So, see, we are working on one or two options for the refinancing. So, in the most unlikely
situation, if the domestic refinancing does not work, then there are other options available to the
company to get the refinancing completed on time.
Guixin Lin: Sure. Can you clarify what other options are available? I think previously there was some
mention of the private placement of a bond. Is that correct?
Saurabh Shah: Yes, there was a discussion around that, but right now other than the domestic refinancing plans
that we have, we are also looking at certain rollover options also. So, those are the plans that we
have for the current refinancing, but we are fairly sure to complete the current plan.
Anupam Misra : I'll add to this. See, first of all, as the management has clarified. there is discussion ongoing with
domestic lenders. And second is there are options in the international market as well. And the
third is, of course, fallback of all of this. I mean, it's theoretical in nature, but yes, fallback of all

of this is capital being provided by the sponsor, including cash available with the company. The company is cash rich.
As well as the fact that there is about INR200-INR300 million of cash already sitting in these SPVs as well. So, to that extent, there are backup options, but we don't think that we will have to exercise option two or three. To clarify, I don't think it was ever mentioned by us or we had made a public statement or clarification around private placement. That was more carried as media rumors, et cetera.
Guixin Lin: Sure, thank you

. That's very clear. And my second question is actually revolving TotalEnergies.
So, just wondering how has the communication with TotalEnergies been? I understand the company don't have any new financing, but do we see any impact for the existing JVs?
Amit Singh: Yes, so I think TotalEnergies, we have a very good relationship and we still enjoy a good relationship. They are working actively in completing the existing projects, which we are working on together in some of the JVs we have put together with them and also they are actively contributing and helping to work as a board member as well as on different aspects of the business.
Some of the comments, I understand you're referring to the press release, they had made and, I think there is no new equity investment which is needed by AGEL. So, AGEL is fully funded to deliver on its ambition and there is no new project in which we are anticipating or expecting to have TotalEnergies on board. So, there is really no financial implication or any other implication, which we should be thinking of from the point of view of AGEL. And also TotalEnergies and us and everybody understands that this is still hearsay and this DOJ is a claim and there is no real claim on AGEL. And TotalEnergies also understands that very well.
Gwee Sin Oin: Sure, thank you very much. That's all for my questions.
Amit Singh: Yes.
Moderator: We have our next question from the line of Samarth Khandelwal from ICICI Securities.
Samarth Khandelwal: Yes. Hi. Sir, my question is on the battery energy storage system side. I just wanted to understand what type of batteries would you be using to implement the BESS system? And secondly, if you get order of the 250 megawatts/500 megawatt hours, how am I supposed to read it? What does that exactly mean?
Amit Singh: Look, I think today, I think if you look at the technology which is in play, LFP battery systems are looking the most attractive for utility scale projects. And we are continuing to, obviously, develop around that. But we are also, in fact, looking at other technologies as they emerge. And we have a technology watch group which makes sure that we don't lose out on any other emerging areas. So, but at the moment, I think our immediate future, we are looking to use LFP battery systems for implementing our battery solutions. Second question, I was not able to understand very well. I think if you could kindly repeat.

Samarth Khandelwal: Yes. So, if an order is placed, you have to install a 250 megawatt/500 megawatt hour battery energy storage solution. So, how much time does it take to charge the battery? And for how much time would I be supplying the energy? Like, what would be the realization? If you could.
Amit Singh: Yes. Okay. I mean, typically, I think if you look at projects for that scale, it can be anywhere between 9 months to 12 months from beginning to finish. And these projects typically, obviously, like I told you, the degradation of these batteries can be anywhere between 1.5% to 3% annually. And input-output efficiency, I would, look at around 85%. So, keeping this in mind and keeping the number of cycles to be around 8,000 to 10,000, you could anticipate these batteries can have a life of up to 16 years.
Now, different contracts and different solutions available in the market look for 12 years or more lifetime, some kind of a degradation profile. So, I would, again, look at it from a project-by-project basis.
And the numbers you see in the market are greatly influenced by that as to how many cycles are allowed and how much degradation is allowed and what is included and excluded. So, it is a very hard to give you an exact number, but that's how I would look at it.
Samarth Khandelwal: Okay. Thank you.
Moderator: We have our next question from the line of Puneet from HSBC.
Puneet: Yes. Thank you so much for the opportunity. My first qu

estion is, what would be the run rate
EBITDA for your current 11.6 gigawatt capacity?
Amit Singh: Saurabh, do you want to take that?
Saurabh Shah: Yes. So, that would be about, from our perspective, that would be about INR10,000 crores of EBITDA that we will generate from the current 11.6 gigawatt capacity.
Puneet: And for FY'25, did I hear it right that you are aiming to add roughly four and a half gigawatt more in this quarter alone?
Amit Singh: Yes. I think the plan is to reach 5 gigawatt of new capacity for this year. So, that number is, yes, approximately that, yes.
Puneet: So, FY'25 and what would be your capacity if you can also give some sense of the break-up between solar, wind, and hybrid?
Amit Singh: Yes. So, the new capacity, like I explained to you, I think 85% will be added on solar and 15% will be added on wind for the new capacity which we are commissioning this year. So, of the 5 gigawatt number we talked about earlier.
Puneet: And if you can also give some sense of what kind of run rate EBITDA that can generate and what will be the debt post that?

Viral Raval: The run rate EBITDA should be INR 15,000 crores plus based on that capacity addition. The debt we are taking is basically on typical 75:25 debt-equity ratio. So, you can calculate the number there.
Puneet: Okay. What is the outstanding debt as of Q3?
Viral Raval: As of now, the net debt is around INR 57,000 crores.
Puneet: Okay. And what should be the capex you are running with?
Viral Raval: Solar with a bifacial modules and trackers, it is around INR4.5 crores per megawatt. Wind is around INR6.5 crores per megawatt for a 5.2 megawatt wind turbine.
Saurabh Shah: Just to add, a lot of this debt which he just mentioned is already this is under construction, this 5 gigawatt. So, a lot of debt is already in place and it is already outstanding. So, that's not going to add straight away for the 5 gigawatt as the additional debt.
Puneet: Operational debt in this INR57,000 crores, what should that number be?
Saurabh Shah: Around INR42,000 to INR45,000 crores.
Puneet: Okay. And on the wind side, are you going to add only your own wind turbines or is there a plan to buy from outside as well?
Amit Singh: I think we have invested in customizing the wind turbine, which is fit for purpose in Khavda to make sure that we maximize generation based on the wind profile and the site specific parameters. We are very happy with the results in the last two quarters based on the wind which came through. So, we don't see a reason to change on that strategy.
Yes, so I think, but also remember the availability and supply chain has been very sound and we want to make sure that, that continues to be the case here.
Puneet:
Amit Singh: Thank you.
Moderator: We have our next question from the line of Arya from Emkay Global Financial Services.
Arya: Yes, thank you for the opportunity. So, sir could you show some light on the PSP projects that we are working on currently?
Amit Singh: Yes, sure. So, I think like we said earlier, we have three projects in flight and we're expecting to complete them before the end of this decade to reach the 5.5 GW target. The Chitravathi project is the most advanced. Our construction started late last year and we're making good progress there. While for other projects, we've also completed a lot of regulatory compliances and clearances and we are approaching towards FC as well. Now, as it stands, we're expecting the Chitravathi project to complete at 500 megawatt by financial year 2027 and the year after is

when we plan to deliver on the Tarali and Gandikota project as well, which will be 1500 MW and 1800 MW capacities respectively.
Arya: Well, that was quite helpful.
Moderator: Ladies and gentlemen, that would be the last question for today. And I now hand th

e conference
over to the management for closing comments.
Amit Singh: Thank you. No, I think it's really a great moment to be in the renewable sector. We are very proud of the large footprint, the more than 15% capacity we have added to nation-wide solar and more than 12% for wind in last year.

We're very excited with the work that the team is doing this quarter to deliver on the incremental
new capacity, which we are targeting to complete. We want to reiterate the work in Khavda is
moving at really, really good pace with more than 12,000 people and we're expecting to deliver
on the numbers we just talked about earlier. Thank you for all your support and, Ashish is here
as well with me, who will be continuing to participate and join this going forward. But thank
you for your support. And yes, all the best to everybody. Thank you.
Viral Raval: Thanks a lot for organizing this call, Emkay and Harsh. Please feel free to reach out to us for
any further questions. Thank you all for joining the call.
Moderator: Thank you. On behalf of Emkay Global Financial Services, that concludes this conference.
Thank you for joining us and you may now disconnect your lines.

Dear Sir,

Sub: Transcript of Earnings Call pertaining to the Audited Financial Results for the quarter and year ended March 31, 2025

With reference to above, we hereby inform below link of transcript of the Earnings Call on Audited Financial Results (Standalone and Consolidated) of the Company for the quarter and year ended March 31, 2025 held on April 29, 2025.

The transcript is being uploaded on the website of the Company.

Kindly take the above on your records.

Thanking You

Yours Faithfully,
For, Adani Green Energy Limited

Pragnesh Darji
Company Secretary

"Adani Green Energy Limited

Q4 and FY '25 Post-Earnings Conference Call"
April 29, 2025

MANAGEMENT : MR. ASHISH KHANNA – CEO
M R. SAURABH SHAH – CFO
M R. RAJ KUMAR JAIN – HEAD OF BUSINESS DEVELOPMENT
M R. ANUPAM MISRA – HEAD, GROUP CORPORATE FINANCE
M R. VIRAL RAVAL – HEAD OF INVESTOR RELATIONS

MODERATOR : MR. SABRI HAZARIKA – EMKAY GLOBAL FINANCIAL

SERVICES

Moderator: Ladies and gentlemen, good day, and welcome to the Adani Green Energy Limited Conference Call, hosted by Emkay Global Financial Services Limited. As a reminder, all participant lines will be in the listen-only mode, and there will be an opportunity for you to ask questions after the presentation concludes. Should you need assistance during the conference call, please signal an operator by pressing star, then zero on your touch-tone phone. Please note that this conference is being recorded.

I now hand the conference over to Mr. Sabri Hazarika from Emkay Global Financial Services. Please go ahead.

Sabri Hazarika: Yes, thanks, Manav. Yes, good afternoon, everyone. On behalf of Emkay Global Financial Services, I welcome you all to the Q4 and FY '25 post-earnings conference call of Adani Green Energy Limited. Today's session will be a discussion on the results followed by question-and-answer round.

Now, without any further delay, I would like Mr. Viral Raval, Head of Investor Relations, for the opening remarks and management introduction. Over to you, Viral.

Viral Raval: Thank you, Sabri. A warm welcome to all the participants in the call. Adani Green Energy has continued its streak of delivering robust operational and financial performance. We hope you would have had the opportunity to go through the earnings presentation that we have uploaded on our website.

Let me introduce the management participants. We have Mr. Ashish Khanna, who has taken the charge as the CEO of Adani Greens from 1st April this year. Mr. Khanna is an industry veteran and a campaigner for green growth. Prior to joining us, he was at the forefront of leading the renewable business of Tata Power as CEO of Tata Power Renewable Energy. His 36 years of career span ranges from oil and gas, petrochemicals, thermal, power, and renewables.

Mr. Khanna has completed Executive Program from IIM Ahmedabad, holds a Master Degree in Management and Systems from IIT Delhi, and is a Bachelor of Engineering from Delhi College of Engineering. We also have Mr. Saurabh Shah, CFO; Mr. Raj Kumar Jain, Head of Business Development; and Mr. Anupam Misra, Head of Corporate Finance at the group. I look after Investor Relations.

Let me now hand over to Mr. Ashish Khanna for brief opening remarks to be followed by a Q&A session.

Ashish Khanna: Thank you, Viral. Good afternoon to everyone and welcome to this call again. I am thrilled to share the outstanding operational and financial performance of Adani Green Energy for the fiscal year 2025. FY '25 has been a record year for India's renewable energy growth. It has been a testimony to the fact of what all has been done by various developers and above all by Adani Green that we have been able to add 30 gigawatts of renewable energy. This also includes the hydro part of it.

At Adani Green Energy, we have contributed significantly by adding 3.3 gigawatt of new capacity. This is the highest ever by any renewable company in India. Our efforts accounted for

16% of India's utility scale solar and 14% of wind power installation in FY '25. We, as always, have done a great job and have added more than double in comparison to any other developer of this country.

We are making significant progress towards developing the world's largest renewable energy plant at Khavda in Gujarat. In a short span of two years, we have been able to operationalize more than 4 gigawatt of renewable energy from that particular plant itself and are well on track to complete 30 gigawatt by 2029.

The potential of Khavda can also be reflected from the fact that in the last quarter, the solar CUF was more than 32%. This all has been made possible because of the advancement in technology which we are deploying there, whether it's bifacial N-type modules, it's single-axis trackers, ou

r

robotic cleaning systems, all are playing their very important role in getting the maximum generation out from Khavda. Our relentless focus on execution, operational excellence, and technology is further cementing our leadership role in the renewable energy sector in this country.

On the financials in FY '25, we surpassed more than $1 billion in EBITDA. Our energy sales increased by 28% on a Y-o-Y basis, reaching 28 billion units. Revenue from power supply grew by 23% to be INR9,495 crores and EBITDA increased by 22% to be INR8,818 crores. We continue to prioritize digitalization, robust capital management, and above all the best-in-class governance system.

Our advanced analytics techniques, automation, AI-driven decision-making processes are optimizing our resources and making sure that our operations are best in class in the world and taking care of the safety as well as the governance is what's helping us and will continue to make us the biggest company in the renewable sector in this country.

As an important milestone in our capital management journey, Adani Green refinanced its new construction facility of $1.06 billion. This long-term refinancing, rated AA+, represents door-to-door tenure of 19 years, and it's well aligned with the cash flow lifecycle of the underlying asset portfolio.

We have a very comprehensive capital management framework to fully fund our growth up to 50 gigawatt by 2030, while maintaining a strict credit discipline. We remain committed to our environmental, social, and governance goals. You'll be happy to note that all of our operations are now water positive, and this goal has been achieved a year before our own target.

We continue to maintain our top rankings in assessment by esteemed global ESG rating agencies, and are ranked number one in Asia among top five globally in RE sector by ISS ESG, while Sustainalytics ranks us amongst the top 10. This all is happening because of the dedication of our team, trust, and support of our shareholders and partners.

I would like to reiterate that together we are committed to create a lasting value for our shareholders, by delivering 50 gigawatt of clean and affordable power by 2030. We are targeting to add 5 gigawatts in this financial year too. Thank you for listening, and apologies for the drops in calls.

Moderator: We have our first question from the line of Puneet from HSBC. Please go ahead.

Puneet: Yes, thank you so much for the opportunity. My first question is on your target to achieve 30 gigawatt by 2029. You are at 4.1 GW, so that's basically, you know, you're looking at five gigawatt annually from here on. What are the key constraints you think you'll have to overcome to achieve this target, whether it's in terms of transmission connectivity or labor, if you can elaborate a bit more on that?

Ashish Khanna: Puneet thanks for your question. I think it's an important question to look at how we are going to achieve. First and foremost, I think what we have achieved so far… the 4 gigawatts has given us the confidence and the learning which we are going to take forward. A rate of reaching 30 gigawatts is very well in place with our additional capacity.

I think one of the learnings are, we have to create a good infrastructure, which we have created in the last 1.5 years for our own employees as well as for the labor, which is world class. You know, it is very important that in a place like Khavda, you have the infrastructure in place for the people to stay and work out there. We are the preferred developer in that region because of the infrastructure which we have created.

Some of the learnings have also come from the environmental aspect, the management of rain and more importantly, the drains, the soil, which we are discovering. All those factors have made us now come to a conclusion that from now on, all of our learnings are going t

o help us definitely
in achieving the 30 gigawatts by 2029. If you have been mapping our quarterly results, then in the last quarter itself, we have 2.6 gigawatts, which we have added in overall share. And then now we are going to take it forward.

Puneet: And transmission, do you worry about that or is that largely under your control here?

Ashish Khanna: We are expecting another 4 gigawatts to be added by June and 7 by the end of this year. I think this is an area where we are keeping a very close track on what's coming in so that our operational capacities can seamlessly flow from the evacuation capacities, which are being available.

We are very happy to see the way the Ministry of Power is also monitoring these aspects, listening to us, mapping not only us, but other capacities too, and then making sure from there that the agencies who are entrusted with that work conform to the timelines which are expected from all the developers to commission their plant.

Puneet: Understood. And second question is on the solar CUF, especially in Khavda. While Q4 you talked about 32.4%, on a full year basis, what is it that you are experiencing in within Khavda? Both on solar and wind, if you can comment?

Ashish Khanna: We are at that place only. You know, please understand the CUF depends on how the Sun God blesses the sunlight on us. The irradiation matters a lot in this process.

Not able to get it across. But on a decent, that's why I exemplify the last quarter, and that will be the quarter in front too. So in monsoon it will change across as such. But on a good sunny day

as we have, like we had the last quarter and we do expect it in this quarter itself, it will be definitely on this range, if not above it.
Puneet: On a full year basis, that's the run rate you experienced last year?
Ashish Khanna: So I think on a full year basis, I think we are going to have a similar run rate in totality. So we're going to have some seasons where it will be dipping across, but some will be even better. In fact, this particular quarter, we are experiencing even better than 32, and that's how we're doing it.
Viral Raval: Just to add, Puneet, so last year we know that there was a stabilization phase which we were going through. And now we're kind of near that stabilization phase. And going forward, the stabilization period will also be much shorter. So from that perspective, what Ashishji is saying is basically we are looking forward to this kind of a CUF on an annualized basis going forward.
Puneet: Okay. But you don't have a, I thought out of 4.1 gigawatt installed capacity, 1460 came in this year. So I thought some would already be operational on a full year basis. That's not the case. Is that how one should read it?
Viral Raval: No, so whatever came up last year is fully there in terms of the stabilization. Whatever got commissioned in the last quarter is under stabilization phase.
Ashish Khanna: So if you look across, while we commissioned the project, there is always a stabilization phase which comes across. And there is a period of a month or two on stabilizing the whole plant. So the last year's capacities are now fully integrated and are performing at their best level.
This year's capacities are also going across. But like I said, since we added the majority of the portion in the last quarter itself, their potential will be known in this or will be fully exploited in this coming quarter and full year. So we are expecting similar CUF for the whole year now.
Puneet: Understood. And if you can remind us, what is the contracted signed PPAs that you have and what is in the pipeline beyond that also? And some nature of those contracts, if you can elaborate?
Ashish Khanna: I'll request Raj.
Raj Kumar Jain: Yes, sure. Thank you. So we have close to 33 gigawatts of projects, which are either in the form of contracted PPAs or the merchant cap

acities which we are already implementing. So roughly
30-odd gigawatts of PPA in there and 3-odd gigawatts of merchant capacity. And obviously, this is only if you look at it from the angle of what is contracted. A lot of our future power is actually getting into the things like merchant, storage etcetera. So a lot of feed is going there.
Puneet: Understood. That's very helpful. And what will be the uncontracted but in pipeline beyond this?
Raj Kumar Jain: So we have said that overall portfolio, we will have a split of 25% and 75% of the capacities. And then within that framework, that 25% has the merchant and the C&I and the CFDs as the capacities. Rest all will be contracted capacities with the relevant DISCOMs and others.
Viral Raval: So of the 14.2 gigawatts that is operational today, 14% is merchant.

Puneet: 14% is merchant. Okay. And this 33 is beyond the 14?
Viral Raval: No. So basically, if you add the PPA pipeline and some more merchant projects, then it goes to 33 in total, operational plus the pipeline.
Raj Kumar Jain: So I think what is important and just to understand the context. Today, getting the PPAs, last year we got some 10 gigawatts worth of bids within our own contracting strategy where we had direct PPAs with Maharashtra, a lot of other PSP PPAs and hybrid PPAs. So within our contracting strategy, we could add 10 gigawatts.
And that's what we have been saying that adding a PPA to what we want to do is dependent on how much and when I want to firm up the revenue stream. Earlier, we were not bidding for good time because we thought it is good that we hybrid our projects for whatever revenue stream we tie up. And that's where you see whatever we have won in the last one year has that tariff numbers being reflecting significantly better premiums.
Now, within that strategy, me having a 33, 34 gigawatt as contracted capacity, I can easily add. I've added last year 10 gigawatt for the contracts. I can always add further more. So it depends on the opportunity which we want to work with. So within the overall framework of 50 gigawatt, if you say 25%, say twelve and a half gigawatt is the capacity which is supposed to remain in merchant, C&I and CFDs. So balance 37 odd gigawatt will be contracted capacity out of which we are already talking about 30 plus gigawatt as contracted. So there's nothing much left now to contract.
Puneet: Understood. That's very helpful. Thank you very much. And I'll come back in the queue. Thanks.

All the best.
Moderator: Thank you. We have our next question from the line of Ketan Jain from Avendus Spark. Please go ahead.
Ketan Jain: Thank you. Hi, sir. So just to follow up on the question, you said what is the capacity under construction right now? Is it 30 gigawatt of project currently under construction? And the follow up was that, as you said, is 30 gigawatt of capacity contracted already? Like, have we identified or have we signed the PPAs already?
Ashish Khanna: Yes, when we say 33 gigawatt out of which, as I said, close to three gigawatts is merchant and the balance is contracted PPAs except for a small percentage, for which we have already got the LOAs which are in the process getting converted to PPAs.
Ketan Jain: Understood. So how much capacity is currently under construction for the group, all the locations? Can you hear me, sir? Yes, sir. Sir, how much of capacity is currently under construction for Adani Green?
Raj Kumar Jain: So I think what we are saying, we are targeting 50 gigawatts by 2030. We today have 14,243 gigawatts already operational. Then we have a run rate. Currently we are targeting close to 5 gigawatts for the coming year. And then we have a growth rate of roughly 25% as a year-on-year increase. As I just explained to you, out of the 50 gigawatts, 25% is supposed to be targeted

towards the merchant, C&I, and other types of contracts. And the balance is towards the PPAs of the traditional nature, but we will be doing high-grade within those PPAs so that we have a better revenue profile there.
Ketan Jain: Understood. Sir, also for FY25 also we had a target of 5 gigawatts, and we achieved around 3.2. What were the major challenges we faced?
Ashish Khanna: I think the important factor which we discussed across earlier today, which has been shared with you in our earlier meetings too, our interactions too, is the environment has not helped us. Our assumptions with respect to the environment remain there and the soil conditions there and the effect of the rains beyond the months where it was raining. I think there was some effect to it, which has now been taken care of.
And these environmental aspects and our preparedness for the same is the prime reason. That's where we are coming back that in the last quarter after having all the learning, because once you have these impacts, then re-mobilization takes a short time, and sometimes it takes longer than it, because the labor has to come from outside and all those things.
So we are taking a lot of, I would say, new initiatives to make sure that this year we are much better in respect to most of the learnings, or in fact all the learnings which we had last year. And that is why we are confident about adding 150% of our last year capacity addition. It is primarily coming from the learnings and how do we deal with it.
Ketan Jain: Understood, sir. Thank you. My last question is on the merchant sales. What kind of realizations are we getting at merchant and do we sell most of it on the exchanges?
Raj Kumar Jain: Yes, so we have merchant capacities and both say in case of solar, the market is giving us around 3.1 - 3.2 as the weighted average revenues there, plus we also have the REC revenues attached to that. So the overall number would be around 3.6 to 3.7 as our expected realization. Now, that is for the last year.
We expect markets likely around the same number for this year, and then probably let us see how it picks up. At the same time, I just want to convey in our merchant capacities which we have set up until now, we have the ISTS waiver also with them, which gives an additional value as the ISTS waiver goes off from June 2025. On the wind side, the realizations are around INR5.5, with the REC we are talking about roughly 6 and then as there again the ISTS waiver would again be a better value creation for us.
Ketan Jain: Understood. So my last question is just a follow-up on this. Going forward, we are seeing excess solar power in the system in maybe the next 2 to 3 years. What is the incentive for a developer to have merchant capacities at that point in time if the solar prices are going to be as low as INR1 rupee or less than INR1 during the day?
Raj Kumar Jain: So I think what's -- just to be very -- so from a strategy perspective, we have been increasing share of the wind in our merchant portfolio, and you would see more and more such capacities being there. The solar capacity merchant has been targeted in a manner to also realize the value around the ISTS waiver until June '25.

Capacities post-June '25, which we are putting up, have the capability of either serving the C&I market, as well as then be available as an input for some of the pumped storage which we are putting up. But at the same time, this is a market which you are seeing today, and as we move forward, we play this strategy dynamically to ensure that there is a maximum value which is realized for the capacities which we are putting up.

Just a year back, you had merchant prices of even solar hours realizing more than INR 4. So we have to see how things move up. Last year, the overall growth of energy sector in India was 4.2% because of the lower growth ra

te in certain quarters. We expect much better scenarios playing out with India's growth now actually picking up. So some of these things will again help in some of the merchant prices.

Ketan Jain: Understood. Thank you.

Ashish Khanna: I would add here that we should not be taking a very myopic view on a short-term basis for a business opportunity. I think merchant remains, and I think we are very balanced in our approach towards merchant. And of course, like Raj said, whenever there are PPA opportunities, we are well-placed to take full advantage of that.

I think one factor is how cost-effectively we can execute our projects and how excellent we are in our operations. If we have these two strengths, then the opportunities can always be taken full advantage of as and when it comes.

Ketan Jain: Yes, understood, sir. Thank you. Thank you so much.

Moderator: Thank you. We have our next question from the line of Anuj Upadhyay from Investec. Please go ahead.

Anuj Upadhyay: Yes, hi, sir. Thanks for the opportunity. So you mentioned the slippages of 1 gigawatt, which happened most largely because of the impact of the rainfall which we had last year. Fair to assume the slippages was fully in Khavda, or there were some other places as well where we saw these kind of slippages?

Ashish Khanna: No, Anuj. On other places, our plan to build a gigawatt in Rajasthan and 250 megawatt at Kadapa has been on track, absolutely on track. They are performing well. It was only, like you rightly understood, it was only in Khavda.

Anuj Upadhyay: Okay. Okay. And any other transmission constraints which we are looking at which might have an impact on the project commissioning? Because this is what we have been hearing from other players as well, you know, like ROW is becoming an issue which are delaying project commissioning. So is there anything which you are witnessing in Khavda or Rajasthan as well?

Ashish Khanna: Like we said, in the earlier remarks to the evacuation, we like you are also looking at it very closely and so is the government too. We have been trying, we have been you know, mapping our capacity expansion in line with what is promised to us, and not only promised, we are also looking at the reality which is happening at site.

Like I shared with you, the capacity expansion in June and further on till December are going to help us a long way from our capacity expansion in Khavda, the way we have mapped it across. There could be a week here or a week there sorts of issues or a month here or a month there, but I think on a overall basis, it is on track, at least for us.

Anuj Upadhyay: Okay. Fair point, sir. Thanks for this.

Moderator: Thank you. We have our next question from the line of Nikhil Nagania from Bernstein. Please go ahead.

Nikhil Nagania: Hi. Thank you for taking my question. There is one very interesting chart in the presentation where you show the mix of sales, how power was sold across the years. And a large volume sold in FY '25 seems to be volume where you have a PPA, but it was sold on merchant.

It happened a couple of years back as well, some infirm power sale. But if you could please share some color on this, how was such a big chunk of sale on the merchant where PPA was already there, was it all early commissioning or was it a grid constraint at the receiver end -- receiving end? What was the reason for that?

Ashish Khanna: Yes, Nikhil, it is again what I mentioned earlier, the testimony of the execution excellence of Adani Green, that our projects have come earlier than what they were scheduled to be and the distribution company, where to go, has given us the NOC of selling this power in the merchant.

So you have rightly guessed it, it is the project early commissioning and which is being fully utilized by us in selling this power in merchant.

Nikhil Nagania: Got it. But just to clarify on that, the m

ost of the capacity which came online on the solar side seems to be the solar plus manufacturing linked PPA, where the PPA was signed for majority in December 2021 for 6 gigawatts. So it is still early commissioning on those assets or am I missing

something here?
Raj Kumar Jain: Yes, Nikhil, a lot of this capacity is prior to their expected COD dates as per the PPA and that is where we have got the clearances from the offtakers that yes, this can be in the interim sold in the exchange market. Over a period, this obviously will move into the PPAs.
At the same time, this is some kind of a cycle. So you would see for at least near future also that some of these capacities will be available for us for selling in the merchant market.
Nikhil Nagania: Got it. So FY '26 also we could see a similar quantum or something around this range come in a similar way?
Raj Kumar Jain: No, I am not guiding that way. I am just saying this is one strategy we adopt if it gets worked and you see the result here. We expect some of the capacity which we have finished this year will get into the PPAs in the near future. We will have few capacities should come in and where we will seek NOCs from discoms and we may be able to have pre-COD power because these are early commissioned. Because as Ashish mentioned, with the way we have planned our capacity execution we are able to commission the projects well ahead of their commissioning timelines.

Nikhil Nigania: Got it. Understood. My second question was on the Chitravathi PSP. Any update on any PPAs for that asset or we do not plan to contract it in the near term?
Raj Kumar Jain: Chitravathi PSP, the progress is going really well. We are on time when it comes to our execution. We have good amount of time still left for deciding on that revenue strategy with respect to that particular project. And we continue to watch the market. We have both the options open as I mentioned for keeping it or entering in the commercial market and then later signing it up or see if there are opportunities which are attractive for us to tie it up. So we keep our options open and we have good time to decide on that.
Ashish Khanna: So Nikhil, if I can add to it. I think important factor from a strategic standpoint for us is to execute project early and best in the class. Now that gives us opportunity which you have been mentioning whether we get it on merchant or otherwise. So, currently our focus is to make sure that the Chitravathi project should be the project which is from the earliest among all the PSPs which anyone else is doing.
And that gives us the leverage as well as the advantage of then tapping it across to various opportunities which are available in the market. And like I said, the strategy today is to execute that project in the least possible time.
Nikhil Nigania: Makes sense. On the same thought, then any plans for merchant batteries as well given the arbitrage we are seeing in the spot prices?
Ashish Khanna: Keeping our close watch on it. It's not that we are oblivious of this whole process of battery storage. There are lots of things which are happening within the company and I think in the times to come you will be one of the first ones to hear from us on that aspect.
Nikhil Nigania: Got it. And one last question if I may ask. There were a few assets, a few sort of projects which were listed as under construction a year back. For example, a 600 megawatt hybrid project with 2.41 tariff. I think it's what …. or a similar name. And there were a couple of wind assets as well where the tariff was about 2.7, 2.71, ARE-7 and another one. We don't see that in the list of operating assets. Are those still under construction or is there a plan to defer them given the tariffs were on the lower side?
Raj Kumar Jain: So the 600 megawatt hybrid is currently under implementation. As it finishes, you will hea

r the
announcements regarding that particular project. We expect to have that commissioned sometime this year.
Nikhil Nigania: Understood. Perfect. Those were the questions. Thanks for answering them. Thank you so much.
Moderator: Thank you. We have our next question from the line of Mohit Kumar from ICICI Securities. Please go ahead.
Mohit Kumar: Yes. Good afternoon sir and congratulations on a good set of numbers. My first question is on the what is the timeline for the 5 gigawatt Maharashtra? Is it fair to assume that the timeline is two years?

Raj Kumar Jain: Yes. It starts from two years and then every six months we have additional 1 gigawatt, 1 gigawatt each. So that is how it is there and we expect to execute it as per the PPA plan dynamics.
Mohit Kumar: So it's 2 gigawatt plus 1 gigawatt, 1 gigawatt each every year, is that right?
Raj Kumar Jain: Yes. So we intend to follow the timelines as per the contract agreement which has been signed.

And if there are any changes on the same, of course it will be known to you.
Mohit Kumar: Understood. A second question is it possible to give us how much you sold a merchant basis during this quarter and what was the merchant utilization?
Viral Raval: We sold it in total around 2.2 billion units on merchant basis and additional 5.3 billion units on merchant basis which were under PPPA. That is part of the presentation.
Mohit Kumar: No, I'm talking about this quarter?
Viral Raval: We can give you the quarterly numbers separately.
Mohit Kumar: I will take it separately understood. My third question is what is the capacity or LOI in the entire 33 gigawatt where PPA is still due to be signed or concluded and an expectation on the PPA signings because we keep hearing that PPA signings are getting delayed. And does it also mean that the biddings have slowed down in the interim?
Raj Kumar Jain: Yes, so roughly out of 9.6 gigawatt which we won in the last year, roughly 6.25 gigawatt we have already signed up. The balance of roughly 3 gigawatt which is yet to be signed. We are already in process of that capacity also something in the future. So, and in the recent capacities only. So as we know it takes some time for capacities to be signed. There is process and all of that which happens.
So, from an exposure perspective we do not have much capacity which are supposed to be signed the PPAs, where the PPAs are pending. Even within this 9.6 gigawatt, roughly 1.4 gigawatt even currently have got the LOA process is clear.
Ashish Khanna: Okay. So, if I can add on, see, I think it is not right on us to generalize the whole point of view about the PPAs being delayed. From our standpoint, two-third of what we have won in the last year has already been signed off as part of the PPAs. The balance are very recent and I do not see much challenge at least for us, but it is not right on us to generalize on a general comment on whether they have been delayed or not. We are very focused on actually what we are doing in the process.
Mohit Kumar: Understood, sir. So, what is the capex expected in F '26. And any color on data will be helpful?
Saurabh Shah: So, in FY '26, as he said, there is a 5 gigawatt of capacity that we are looking to commission, out of which nearly about 95% of that is now under various sanctions as such. So, we have the debt tie-up done for that and we do not see any challenge on that kind of debt tie-up.
Mohit Kumar: Is it right to say that all of this has come from the domestic sources, mostly REC and PFC?

Saurabh Shah: It will be generally from domestic sources for the current year, because we already have the sanctions in place. So, it is generally coming from domestic sources, yes.
Mohit Kumar: Understood, sir. On the wind portfolio, CUF seems to be on the lower side at 27%. Is it by design
or do you expect it to improve as the entire F '26?
Ashish Khanna: I think you have to look into the age of this portfolio as such and I am very hopeful. So, we have assets which are of a different class and have been built at a different time frame, but I am very sure that the next year when you will be looking at us and more and more of our capacities in the range of 5.2 megawatt turbines, which has more than 35% of the CUF in Khavda is going to come in place, you will find that the overall basis to this year will rise, notwithstanding the fact that the last year wind has not been as per what we have been assuming and that you would have seen across all developers.
The wind is not only specific to us as a cause of lower CUF as such, but like I said, in our portfolio with more and more inclusion of these 5.2 megawatt amazing India's largest machines at Khavda, you would see a much better CUFs on an overall basis too when their majority increases.
Mohit Kumar: So, what is the timeline for execution of the UP PSP? Is it 5 years or 4 years? Can you please conform that number?
Ashish Khanna: 72 months, 6 years.
Mohit Kumar: Understood. Thank you and all the best.
Moderator: Thank you. The next question is from the line of Baiju Joshi from Macquarie. Please go ahead.
Baiju Joshi: Thank you for the opportunity. I just had a couple of questions. Firstly, on the evacuation capacity from Khavda, you briefly touched upon it, but I just want to understand near term and the 7 gigawatt you mentioned by the end of this year and even in long term. I just wanted to understand how bottlenecks in creating this capacity can impact Adani Green, and how insulated or impacted could we be from this evacuation capacity expansion?
Secondly, my question was, I just wanted your thoughts on ISTS waiver that is ending in June.
So, the first question was on evacuation capacity from Khavda that you briefly touched upon. I just wanted to understand how insulated or impacted would the company be, in case there are bottlenecks in this capacity expansion? Second question was on ISTS waiver that is coming to end in June this year, and there have been talks of extension. I just wanted to know your thoughts

on that.
Ashish Khanna: Thanks, Baiju. So, I think we touched upon very clearly. We not only touched upon, but we discussed in detail that the current plan of evacuation, especially from Khavda, which are also monitored by the Ministry of Power very closely, and in many of the meetings, we are also participants out there, gives us an indication that by the June this year, there would be an additional capacity of 4 gigawatt, and by December, we will have a 7 gigawatt.

In our scheme of things, it should be fine with us as we are looking at their additional capacities with our commissioning of projects at Khavda. Regarding the point on the ISTS waiver, I think it's a generic question. We all know what the Government of India is currently taking its view on.
We are also closely watching the situation. As you know, we are not the decision makers. We will follow that, but the policies of it. Currently, our strategy is to go with the policies and not to take over risk on any assumptions with respect to the ISTS waiver is concerned. That we are enhancing our organization from it, but if there is any change, of course, we will re-strategise accordingly.
Baiju Joshi: Thank you very much.
Moderator: Thank you. As there are no further questions, I would now like to hand the conference over to the management for closing comments.
Ashish Khanna: So let me, again, thank you, each and every participant, including the organizer. I'd like to reiterate again here that we are committed as a team to deliver the best in the country and are also committed to have the best of the operational excellence for it. The technologies which we have deployed in

the last year, have actually paid us very well and is also testimony of our performance in operations as well as execution.
We are very confident on what we have projected in this particular year with all the learning and the dedication and the motivation of the team which we have here. We look forward for having more success as a part of our organization. Thank you so much.
Viral Raval: Thank you very much. Thank you Emkay team for organizing this call. Thank you, Chorus. Thank you all the participants for taking the time out to join this call. Please feel free to reach out to us if you have any further questions. Thank you.
Moderator: Thank you. On behalf of Emkay Global Financial Services Limited, that concludes this conference. Thank you for joining us and you may now disconnect your lines.

Adani Green Energy Limited

Q1 FY '2 6 Post -Earnings Conference Call
July 29, 2025

MANAGEMENT : MR. ASHISH KHANNA – CEO
MR. SAURABH SHAH – CFO
MR. RAJ KUMAR JAIN – HEAD OF BUSINESS DEVELOPMENT
MR. VIRAL RAVAL – HEAD OF INVESTOR RELATIONS

MODERATOR : MR. BAIJU JOSHI – MACQUARIE CAPITAL

Moderator : Hi. Good afternoon, everyone. Welcome to Q1 FY '26 Earnings Call of Adani Green Energy Limited hosted by Macquarie. Without any further delay, I will hand over the mic to Mr. Viral Raval, Head of Investor Relations, to start the proceedings. Viral, over to you.

Viral Raval : Thank you, Baiju. Very good afternoon to everyone. Thank you for joining us for the earnings call of Q1 FY '26 today. We have with us Mr. Ashish Khanna. He's the CEO. We have Mr. Saurabh Shah, CFO. We also have Mr. Raj Kumar Jain, Head of Business Developm ent. I will now hand over to Mr. Ashish Khanna for brief opening remark s, which will be followed by Q&A. Thank you.

Ashish Khanna : Thanks, Viral. Good afternoon, everyone. I'm excited to share the outstanding operational and financial performance of Adani Green Energy for the first quarter of fiscal year 2026. India has achieved 50% installed non -fossil fuel energy capacity in its pow er mix, five years ahead of 2030 target. This highlights India's effective climate action, strong policy momentum, and robust private sector execution. Surpassing a historic milestone of 15 -gigawatt operational renewable energy capacity, Adani Green Energy is proud to have helped in accelerating the transition to clean energy.

In Q1 FY '26, we added 1.6 -gigawatt of greenfield renewable capacity, totalling 4.9 gigawatt in the past year, a record achievement for India's renewable energy sector. With this 45% year -on-year increase, our operational capacity now stands at 15.8 gigawatt. This not only demonstrates our best -in-class project execution capabilities but also reaffirms our position in India as India's largest renewable energy company.

A major highlight has been our continued progress in developing world's largest renewable energy plant of 30 gigawatt at Khavda, Gujarat. As of June 2025, our operational capacity at Khavda stands at 5.6 gigawatt of solar, wind, and hybrid energy portfolio s. Backed by a robust capacity addition, Adani Green Energy achieved a record growth of 42% in its energy sales on year -on-year basis, reaching 10.5 billion units in the quarter.

Coming to the financial performance, our revenue from power supply increased by 31% year -on-year to INR 3,312 crores and EBITDA rose by 31% to INR 3,108 crores, delivering industry -best EBITDA margin of 92.8%. Cash profit surged by 25% to INR 1,744 crores.

These exceptional results are a testament of our robust business model, exemplary project execution capabilities, consistent operational excellence with the deployment of advanced renewable energy technologies and digital solutions across our portfolio. Our ope rational excellence was recently recognized with the CII Performance Excellence Awards 2025 for some of our plants. Our strategic selection of resource -rich states like Khavda in Gujarat and other sites in Rajasthan have also helped in delivering stro ng operational performance.

At Adani Green Energy, we are committed to environmental and social causes, while upholding the highest governance standards. The company has earned the top spot in FTSE Russell's ESG scores in the global alternative electricity sub - sector, as well as earned recognition from Reuters Global Energy Transition Awards 2025 held in New York. The company is also ranked first in Indian power sector by NSE Sustainability Ratings and CRISIL ESG Ratings in the latest ESG assessments.

With a comprehensive capital management framework, we ensure that our growth is fully funded for our 50-gigawatt target by 2030 while upholding strict credit discipline.

In conclusion, Adani Green Energy remains steadfast in its commitment towards accelerating India's clean energy transition by consistently delivering affordable clean energy for all , with focus on execution at unprecedented scale and speed, operational excellence, and best -in-class governance.

Thank you.

Moderator : Thank you, sir. We'll

now start with the Q&A session. Participants, please use the Raise Hand feature to ask any questions. We'll take the first question from Mohit Kumar. Mohit, please go ahead with your question.

Mohit Kumar : Good afternoon, sir, and congratulations on a very good quarter. Sir, my first question is on the gross block. Is it possible to share the gross block and run -rate EBITDA for 15.8GW capacity?

Saurabh Shah : So, the current gross block of the company is INR 89,000 crores approximately,

and the run rate EBITDA for the Q1, it is about INR 13,600 crores. And on a yearly basis, it will be about INR 17,000 crores.
Mohit Kumar : Rs. 13,600 crores for 15.8 -gigawatt capacity, am I right?
Saurabh Shah : Yes.
Mohit Kumar : Understood, sir. My second question, sir, is it possible to share the capacity commissioned in value term in Q1 FY '26? If I remember number correctly, I think we have installed 1.6 gigawatt, correct?
Saurabh Shah : Yes.
Mohit Kumar : And is it possible to share the capacity commissioned in terms of value rupees crores?
Saurabh Shah : Okay. So, the CapEx, see, generally our CapEx is in the range of, for the solar, it is INR 4.5 crores; for wind, it is INR 6.5 crores. So, the current CapEx for the first quarter of current year booking was about Rs 6,500 crores.
Mohit Kumar : One clarification on the accounting side, the associate income, I think we booked in the quarter of INR 111 crores.
Saurabh Shah : Yes.
Mohit Kumar : Is it primarily due to Mundra green, Mundra technology, that solar manufacturer?
Saurabh Shah : It's Mundra Solar Energy Limited, where we have 25% stake within that company. So, whatever profits they generate, we get a 25% share of the same.
Mohit Kumar : But that's the only thing, which is driving the associate income, right?
Viral Raval : It's only that. A 2 -gigawatt manufacturing capacity which was set up under the PPA, which was basically linked to manufacturing.
Mohit Kumar : My last question, sir, I think we are given the target of 5 gigawatt in this fiscal, and I think, if I'm not wrong, I think next year, we are also expecting 5 gigawatts, right? Given the fact that, all the -- most of the capacity are coming in Khavda, do you see any transmission challenges which are coming up, which are causing some challenges in commissioning these capacities?
Ashish Khanna : It's a valid point, Mohit. I think it is very difficult to tie both the things, your capacities with the transmission capacities. There will be always some lag of weeks or months in that process. Having said that, in the current context, yes, there is a li ttle bit of a challenge coming from Khavda evacuation. However, having said that, it's hardly less than 5% of our EBITDA as we speak. We are very closely monitoring and largely supporting how the evacuation from Khavda is coming out. And we do believe that this fiscal year and much before that, there will be enough evacuation for us to evacuate everything. So, we don't foresee a big challenge in the coming quarters. But yes, a few weeks here and there, can always be an overlap in this process. Good part is that, if you look at in the Q2, most of what is going to be evacuated will be wind more than the solar. And hence, that daytime challenge is also mitigated from that standpoin t.
Mohit Kumar : Understood, sir. Thank you. And all the best. Thank you.
Moderator : Thank you. We will take the next question from Siddharth K. Siddharth, please go ahead.
Siddharth K : Good morning, sir. Sir, my first question is regarding the solar CUF, capacity utilization factor. In this quarter, we were close to 28%. But in the earlier presentations, we had mentioned that it was 32% in the Khavda region. So, the lower CUF this quarte r is due to the early monsoon?
Ashish Khanna : I think, you see Khavda has the distinction of one of the best irradiations possible. And so, our CUF there is always hig

her. As and when the proportion of Khavda in the overall portfolio is going to increase, we will appreciate more and more CUF come in on the higher side in our overall portfolio. So currently, since i t's only one -third of it, you will find that it is much lower than Khavda.
Siddharth K : Okay. Sir, for the full -year projection, what should be the solar CUF be? Like, what will be the range?
Ashish Khanna : I think it'll be same, with a few percentile points above it because of Khavda, more and more capacities are going to come out there. So, we will have on the increasing side.
Siddharth K : So, on a conservative basis, it's fair to assume 28%, like, overall?
Ashish Khanna : Of course, of course.
Siddharth K : And sir, my second question is regarding the merchant price. Like, what is the average merchant price that we sold for the quarter?
Ashish Khanna : On the solar side, our average is Rs2.20, but the wind has been nominally well at Rs5.70.
Siddharth K : So, like the trend for the solar merchant prices have gone down sharply. So, going forward, like what are we projecting or how is the trend moving forward for the next two quarters, three quarters? Will it stay around INR 2.00, INR 2.50, or are

we seeing a ny uptick?
Ashish Khanna : You see, the merchant prices are always very volatile. We are not in the market of predicting, the prices. Having said that, our strategy is very clear. Almost all our capacities , majority are on the PPA front. And so, and the other advantage which we have is that if we have some merchant capacity, which are primarily coming because we are ahead of our PPAs, and we are selling that capacity as a merchant, so that becomes an add -on to our overall financial model. So that's an advantage to us. But to be frank to you, to predict how the prices will pan out in future, it is very difficult, and it remains volatile. We do expect – like last year, it has improved in the later part of the d ay. There have been pre monsoon this time, which has impacted certain solar prices. And then because of Operation Sindoor too, there has been certain curtailment which we have experienced. But like I said, this is too small a window to then predict how the year will pan out on t his. But we remain steadfast in our strategy towards investing more on -- or building more on the PPA part and when our capacities come early, sell them on the merchant because that becomes an addon.
Siddharth K : Right. And sir, going forward, like we have 3.5 gigawatt of like approximate target for this year. So, when can we expect, like what in Q2 or -- and Q3?
Ashish Khanna : See, we are on track. If you see on a 5 gigawatt target for the year , we have already done around one -third . What is expected from the next three quarters , if you ask me, we are very well on track. We're on track for these capacities . You will be there with us after three months and we will share with you what we have added in the next Q2.
Siddharth K : Sure, sir. Sir just a clarity on the ISTS waiver part. What and how exactly does this affect us being a renewable generator and this -- like, will we increase the tariff prices because of this?
Ashish Khanna : As I said, we are not in a market of forecasting tariffs per se. All of us knew, this ISTS thing is going on and is going to be off from June 1. And I think we all have built our strategies based on that part. And ISTS has not gone off full. It remains, 75% remains, only 25% have gone off on this. We don't foresee a major change in the market p ricing in near future. Let's see how it pans out in the longer term. Raj, you want to add something?
Raj Kumar Jain : Yes, sure. I think, what's important is we have built certain capacities which was part of our merchant portfolio until June. So there -- obviously, there is a higher advantage of those capacities, so we could secure that for our portfolio. As Ashish menti oned, th

e taper down is in a timebound manner of three years, where today the taper down is by 25%. So, there would be some more merchant capacities we are adding now. So, these are valued in the market better than the capacities which will come later. So, we have that advantage. That advantage is realized when we do contracts with the parties because, ultimately, they are supposed to pay the cost. So, you will see some of these capacities getting advantage in the market.
Siddharth K : Right, sir. And sir, just the line item on the sales of equipment. So, what exactly are we selling in this?
Saurabh Shah : So, see from the sale of equipment that we do, it is mainly - from a standalone perspective, it is a sale to the various subsidiaries that are there , and on a consolidated basis, it is more to do with certain group companies where we are doing certain projects for them, on th eir behalf, there are certain kinds of sales that happens to them. But that is not having any major impact on the P&L.
Moderator : Thank you. We'll take the next question from Sabri Hazarika. Sir, please go ahead with your question.
Sabri Hazarika : Yes, good afternoon and congratulations on a good set of numbers. So, I have two questions. Firstly, this merchant and infirm power, that is, mostly wind only, right? I mean, the sale of power of say around 2,000 units. So that is mostly wind or what would be the segregation like?
Raj Kumar Jain : No, it's a mix of solar and wind both. And it is also pre -COD power for some of our PPAs. So, what we do is, obviously, there are transmission connectivity deadlines. We commission the projects much ahead of that and see that our returns in those projects are enhanced because of this early commissioning of projects, which are not necessarily baked in when we do the bidding. So, we are adding that much value. So, there is revenue coming from those projects. Plus, we have pure-play merchant p rojects where we have multiple optionalities for future. There is revenue to that. So, it's predominantly solar if you ask me. On an overall merchant strategy, yes, you are right, that it is tilting towards more wind projects taking the shape of merchant revenue in proportions more.
Sabri Hazarika : Okay. And regarding your wind, I think, this CUF also like, probably one of the

best. So, how are you seeing the wind cycle currently around Khavda? Do you think that we would be at a higher level compared to what it has been for the past 1 year, 1.5 years?

Ashish Khanna : Sabri, it is very difficult to predict wind like this time, we have seen, if you look at it from India standpoint, we have witnessed that the wind at Rajasthan was at a lower level than the wind at Khavda now. And since we have the better machines and 5.2 megawatt capacities, which are the largest in the country, of course, our CUF has been the best one can imagine on this. So, we do foresee, and we do expect that the forthcoming winds is going to help us. But if you 're asking us to predict the wind, then it is difficult for us. But yes, when the wind will come, our CUF will remain the best as they have been showcased in the last quarter.

Sabri Hazarika : Right. So, second question is on your other expenditure. So, there has been some reclassification, I think the foreign exchange part, I think you've clubbed it in one of the expense. So, this INR 300 crores are basically, what could be the adjustments? Is it foreign exchange or something else is also there?

Saurabh Shah : No. Where are you seeing that adjustment , Sabri, if you can just guide me, I will be able to then answer you.

Sabri Hazarika : I think, I mean you have that foreign exchange gain and loss, I think, which is part of finance cost, right?

Saurabh Shah : Yes. So, see, there is -- there are two parts to it. There is a foreign exchange gain loss, which is either shown in the part of other income, which is there as a gain in
th

is quarter, very small number. In case of the finance cost, that foreign exchange is basica lly the hedging cost that we pay, plus whatever the ERD that we have to value the loans which are there as ECBs in terms of those valuation, fair valuation that we do at the end of the quarter, whatever the unrealized gain/loss that occurs is also part of the finance cost in that case.

Viral Raval : So, the representation basically has changed to make it very clear whatever is attributable to finance cost is now part of the finance cost only.

Sabri Hazarika : Right. Got it. And this increase in other expenditure is basically because of increase in capacity?

Saurabh Shah : Yes. So that's proportionately based on the O&M expense that goes up because of the capacity increase and various other expenses which are part of the capacities rising due to that.

Sabri Hazarika : Right. Secondly, I mean, we have this -- we are -- we are amidst this high monsoon season, but have we seen any kind of, like, not -- have you seen any kind of similar experience what we faced last year, or we are like much better off this time?

Ashish Khanna : I don't know what you mean by much better or similar experience, yes, we have seen monsoon in the past and monsoon is again here today. It has its own, I would say, impact, especially on Khavda. May not be to the same extent at our Rajasthan sites. We are well prepared, much better prepared this time from the monsoon -- for the monsoon. But yes, it is still going on. So, I would like you to be there in the next call for you to share with you how better we were placed this time. It also depen ds on the intensity of the monsoon, its impact on it. Still early days, but yes, to reassure you, we were, and we are much better placed this time from the lessons which we have of the last time, especially in Khavda.

Viral Raval : Just to add, so last time, if you remember, across India, the monsoon had extended by about a month or so. This time, we'll have to see what happens, but I mean, normally these occurrences are less.

Ashish Khanna : Yes. But from our side, we are better prepared. Let me reassure you on that part.

Sabri Hazarika : Right, sir. Thank you so much for the detailed explanation and all the best.

Ashish Khanna : Thank you, Sabri.

Moderator : Thank you. We'll take the next question from Mahesh Patel. Sir, please go ahead with your question.

Mahesh Patil : Yes, sir, my first question is on the growth of energy sales, if we see that is around 42% in this quarter by Y -o-Y . However, the revenue growth is around 30%. So just wanted to understand, and since we have sold, I think more than 40% in merchant market, so is this because -- solely because of that, the lower merchant prices?

Viral Raval : Yes. Predominantly you can attribute it to that. So, as earlier said, so merchant prices are volatile, and it is basically part of the business case when you talk about pure-play merchant. So, we have two parts, about 50% of it basically pure -play merchant and 50% is infirm revenue. So, the infirm revenue where we have sold on merchant markets, it is basically the pre -COD revenue before commercial operation date. So that entire revenue is incremental to whatever, basica lly, we were going to earn under a PPA of 25 years.

Second part, the merchant revenues, as I said, it is volatile. In Q1, it has been less because of the monsoon arriving early and possibly things could change in the later quarters. The third part is the new PPAs that we are implementing. Gradually, over many years, the tariffs have gone down and that is because of the technology evolution and CapEx going down. So, the return expectations on the PPAs remain the same, but the tariff trajectory is down, and the CapEx is also down. So, these are the combination of reasons because of which it appears so. But from a return expectation standpoint, we are not really compromisin

g in any way.
Ashish Khanna : And if I can add on, since the merchant rates for the wind are much better and this is a time for better winds in India, we do expect that in this quarter, with more and more wind going into the merchant with a higher rate, the proportion would be much bet ter.
Viral Raval : So just to again quote, the realised tariff for merchant wind is almost INR 5.7 per unit.
Ashish Khanna : And sorry, just add more and especially with our CUF, things will be much better.
Mahesh Patil : Got it. Thank you. Sir, my second question is on the -- because of this early monsoon onset and since there was this solar overcapacity, so was there any back down due to the grid during, particularly during the peak solar hours that we have faced in this quarter?
Ashish Khanna : Yes, we did mention earlier too, there have been certain back downs with respect to grid evacuations. But at the current level, it is less than the 5% of our EBITDA margins as such. And I think we had a detailed discussion, I can say or explanation on how the evacuation capacities are going to come and how we are mapping them and monitoring them so closely in that particular manner. And like I said, since in this quarter , the solar would be relatively less and the wind would be high, we do believe, and because of the timings of the wind, which are generally more in the evening hours and in the morning hours, we don't expect that much impact on the wind part of it. And solar in any case would be lesser in the last year.
Raj Kumar Jain : So, I'll just add one more thing, Mahesh. This is the way transmission works in India, when a capacity is given transmission connectivity, it is given with five, six elements. So, suppose in Khavda, we are asking for connectivity, it will be given to us fo r say 1,500 -megawatt, 2,000 megawatt, or 3000 megawatts with certain elements. We are supposed to build the capacity of that much capacity by that date. So, one fine day, everything is available. Prior to that, some lesser amount of evacuation is available. So that's the nature of transmission. Now, that would obviously mean that I will set up the capacities prior to that period or in a gradual pace, and I may see certain kind of lesser capacity available in the system than what would be required for the overall number. And that is the reason you see this two month to three months plus/minus happening and some kind of curtailment or grid limitation co ming in. But that's the nature, the way industry works, especially for people who want to finish things prior to their dates. So that's how it may happen. Sometimes we are lucky, and the system has some redundant capacities, which allows us to push in entire thing even though the full transmission has not come in. So, these are the things which we plan much ahead and we know what's happening, what's happening on each element, and what kind of evacuation we will see. So, we know it, what is happening, and we try to see that our capacities are aligned in a manner where we do not see big risk in this.
Viral Raval : And just to clarify, this is primarily pertaining to merchant and infirm, not with respect to regular PPAs .
Ashish Khanna : Yes. And again, let me reassure you that the way we are monitoring it, it is not a matter of years or things like that. The capacities are coming, and we are closely monitoring it. It's a matter of weeks or months, nothing more than that.
Mahesh Patil : Okay, sir. Got it. And sir, one more question on the bidding strategy and the pipeline. So, do you see any major tenders like the 5 gigawatt from Maharashtra last year? Anything in the pipeline and what would be our bidding strategy going forward, since we already have, I think close to 33 gigawatts of locked -in capacity?
Raj Kumar Jain : Yes, so, obviously, we continuously look at what are the evolving opportunities in the market. The Maharashtra one was a great t

ender for us to win, and we could get that as part of our PPA pipeline, or under construction projects. It adds significant valu e to what we have in our portfolio. We would continue to look at opportunities where we can get that additional delta or alpha for our stakeholders. That has remained our strategy. If you see all the projects which we have won in

the last few months or quarters, are significantly value accretive in terms of what tariffs which we have got, and the way we are planning to them to execute. So, we continue to look at that and we are there in market for certain projects where we make this additio nal delta.
Ashish Khanna : And if I can add, so on this, what Raj is saying, you see, if you look at our overall target of 50 gigawatt and if we map our current portfolio, so we don't need to be very hungry and go very aggressive on the tenders. We choose the tenders, which gives us the predictable and better returns. On an overall scheme of things, we are currently, as you know, is 15.8 gigs on our operations. We have 16 gigs on under execution right now. And the recent tenders, which we have won is another 5 gigawat ts out there. So, if you look at it with our overall portfolio and our target of 50 gigawatts, we must be selective where we get the decent returns as per our benchmarks. And more importantly is then execute in a manner which gives us the return which are required for it. So, it's not only just winning, but also the matter that you win, then you execute an d then you get the returns. And that's our overall strategy for it. And that's why we are not desperate. We pick what -- where we feel is the best place for us.
Mahesh Patil : Got it, sir. Sir, one last question. Out of this, around 33 gigawatt of locked -in capacity that we have, what is the capacity that is tied up under PPA, if you have that number?
Ashish Khanna : Yes, we have, as I I talked about 36.5 gigawatt in total, which is coming across. Within that, 31.5 gigawatt is what is currently with the PPA. If you total what I have told you, it'll total to around at 36.5 gigawatt. Like I said, 31.5 gigawatt of it is under PPA.
Mahesh Patil : And remaining is for merchant purpose, right?
Ashish Khanna : Remaining is for the merchant purpose, which can go under a PPA in the C&I segment too.
Mahesh Patil : Okay. And sir, this Adani -Total JV , how much capacity is operational and how much is in pipeline right now?
Viral Raval : So, total 4.5-gigawatt portfolio we have, and out of that, roughly 4 gigawatt is operational right now in the JV .
Mahesh Patil : Okay, sir. Thank you. Thank you, sir. Thank you so much. That's it from me.
Moderator : Thank you. We'll take the next question from Puneet Gulati. Puneet, please go ahead with your question.
Puneet Gulati : Yes, thank you so much. My first question is, we are not seeing you in the FDRE market. You 're there in wind, solar hybrid. Is there anything we should read into that?
Raj Kumar Jain : No, I think, we just said that we are very selective in what we do. And we want to see tenders where we know that the tie -ups would happen and we would make returns better than what market is making. So, all of those are the considerations where we choose what we want, where we want to be. We are in some FDRE tenders where the storage is there. So, it depends on the tender data, but yes, we have our own strategy about participating and winning some tender s.
Puneet Gulati : And any thoughts about adding battery to your currently merchant capacity?
Ashish Khanna : Oh, yes. Puneet, we are evaluating all options right now. We have a strategy in place; you will hear from us about it. I don't think so, this is a platform for us to declare our overall strategy. But yes, we are very seriously looking towards it. We have plans towards it. At a very appropriate time, you 'll also hear in overall context of i t, but please be reassure

d on that part. We are Adanis. We do things at a scale and at a level and at a time which is most appropriate for us from a retur n standpoint.
Puneet Gulati : Understood. And lastly, you talked about revenue from early commissioning of projects. Our understanding was that thing was now done away. You can't early commission. Are there some projects for which there have been some exemptions?
Raj Kumar Jain : So, it really depends on the PPAs and how the -- when are we commissioning and what are the conditions of such commissioning when we are commissioning them? So, I think that's what I was alluding to you earlier, is that if my transmission elements are still not there, I'm commissioning capacities, then there are certain cases wh ere I am able to do this pre -COD power. Obviously, it is dependent on, the buying party, how they look at it, how would they -- what -- how -- what kind of condition s they want to put up for that purchase. So, it depends on PPA to PPA.
What we are telling you is that we have significant capacities, where we have been able to achieve this and where we are supplying that power on a pre -COD basis, including in some cases to the PPA counterpart also. In both the cases, obviously,

it adds rev enue to the already bid -out number or bid -out returns which we had.
So, it's an additional earning which we can do.
Ashish Khanna : So, Puneet, there is no debar on this. If I can add on it. PPA has certain stipulations under which you can sell. But you are right, it is not by default that you can sell it on merchant. You must take certain approvals by both the parties, but it's a part of the agreement and you follow those procedures, take the requisite approvals, and then do -- you -- one can, not only us, but anyone can sell that.
Puneet Gulati : And this is only where your transmission is not up?
Ashish Khanna : Yes.
Puneet Gulati : And if you can explain me the mechanics here, how does that work? If transmission is not up, how are you able to sell on the ISTS merchant?
Ashish Khanna : I think, Puneet, we can take this up separately, how the regulations and rules are and how the PPA construct is separately, probably not apt for this call.
Puneet Gulati : Okay. That's fine. Great. Thank you so much. Yes.
Moderator : Thank you. We will take the next question from Siddharth K. Siddharth, please go ahead with your question.
Siddharth K : Sir, can you tell us what is the gross debt levels for the quarter? And what was the borrowing cost?
Saurabh Shah : So, the gross debt as on June 30 is INR 78,000 crores. And borrowing cost is generally, currently the range is 9.1% to 9.2% for us.
Siddharth K : And for the full year, are we expecting it to come down?
Saurabh Shah : No, gross debt will not come down for sure. The borrowing cost, yes, we are looking to refinance certain portion of our assets. So, from that aspect, we will keep on looking at it from that perspective. See as such, because we keep on adding new constructi on also, so it'll not be coming down very drastically. But yes, we keep on evaluating and looking at how refinancing takes place and thereby reduce the cost to whatever extent we can from the existing operating projects.
Siddharth K : So, regarding the merchant price you mentioned, it was INR 2.20 for solar and INR 5.70 for the wind. What was the prices last quarter?

Saurabh Shah : Q4, yes. So, see, what happens is that the wind merchant prices generally for Q3 and Q4 are generally a bit lower. So, it was in the range of about INR 4.70 in wind.
And for solar it was near to INR 3.00.
Raj Kumar Jain : It was about INR 3.00 in the Q4 of last year. And so, that's where I think it's more seasonal. And you would need to see full -year trends before making a view around how the prices would be. Obviously, we continuously monitor what are the demand and supply sources for the power, as well as how the weather patterns

are
emerging. But at the same time, it is something which is volatile and that's part of the business strategy when we say that we want to do certain capacity on the merchant side .
Ashish Khanna : And let me add on this, Siddharth, for you. I think we should not be looking at these prices on a quarterly basis because there is a strategic intent for the whole year. You will realize that India's requirement of power, renewable power, it has its own cy cles of pluses and minuses on it. So, why the solar was a bit higher in the last quarter and why it is coming, it is obvious that you have more solar which will be generated in this quarter , which will not be the case in the future quarters too. So while your question is valid, but you will appreciate that when one looks at it as a merchant with respect to solar and wind, one must look at it for the whole year on an average rather than on a very specific period.
Moderator : Thank you. We'll take the next question from Anuj Upadhyay. Anuj, please go ahead with your question.
Anuj Upadhyay : Thanks for the opportunity. Sir, could you just elaborate on the two PSP projects in the Andhra Pradesh, which has been cancelled , but Kurukutty and the Karrivalasa PSP projects? And would this cancellation have any kind of an impact on our targeted 5 gigawatt of PSP edition by FY '30 -'31?
Raj Kumar Jain : So, that does not -- to be very clear, that does not impact our 5 gigawatt of PSP additions. We have significantly more pipelines in terms of the opportunities which -- for which we look at execution even beyond FY '30, and as well as, as upsides to our cu rrent plan of 5 gigawatt. We evaluate multiple capacities and that's how something will come in and something will go out based on various scenarios.
Viral Raval : Just to add, so from our side, we have only declared 1 ,250 megawatt of PSP which is for UP PCL, which is what we have won. And we have also announced 500 megawatts , where we began construction in Andhra Pradesh. So, there are multiple evaluations which keep on happening. So, you must take it into

consideration only when we announce it when we have reached a t a particular stage on that project .
Anuj Upadhyay : Okay. Fine. But only thing is, see, these 5 gigawatts or the other potentials is on card, but it's only the timeline which I'm worried about. So –
Raj Kumar Jain : So, I think, Anuj, let me be very clear, the 5 gigawatt which we have announced, and we made it very clear last time also that when we announced the capacity, those are de -risked from all these considerations. So those projects which we have announced are completely identified. They have made their own progress, whether it is in terms of approvals, land rights, et cetera. So, nothing of that is impacted.
Anuj Upadhyay : Fair point, sir. So, those 5 -gigawatt come by '30 -'31 kind of timeline?
Raj Kumar Jain : Yes. There is no change in any of that. Yes.
Anuj Upadhyay : Secondly, sir, are we seeing any kind of labor issues in terms of execution? We have been hearing across other players as well, where Labor availability is a concern, whether it's on the EPC front or evacuation on the transmission side. So, are we facing similar kind of an issue at Khavda as well? And if yes, what measures are we taking to address it?
Ashish Khanna : Thanks, Anuj. I think you must appreciate the fact that when you are -- when someone has an aspiration to grow at this level and build a project like Khavda, the good part is that for us and as well as for the labor, you have next five -year horizon available with them. Important factor, if you look at it, is this transition from one project to the other. It's not that the labor is not available in this country. So, like what we have done is that we have created infrastructure for them, our labour colony is the best equipped. We have cre ated infrastructure; we are giving them the facilities. So, and

they don't have to move on from X to Y . Typically, in a solar plant, if you look at, the challenge is that you build that solar plant in nine months' time , and then again, they have to move from X to Y area. The best part about a place like Khavda is that we are there for next five years for 30 gigawatts . Having created that infrastructure, having given them the facilities, I would really request and suggest please come to Khavda and look at th e way we are supporting and facilitating this labour to stay, to play, having the best food for them, and all the other infrastructure which we have created for them. I think having the run rate, having contractors -- we don't even call our contractors - contractors, we call them partners. So, taking care of the partners who are then taking care of the labour , and we are ensuring that their medical facilities, what they 're eating, where they 're working, all of that will be above par from any other competi tor or what you see in a solar segment in this country. And that's why I think we have been able to achieve what others take a year to build, we do it in a quarter. And I think the contribution goes primarily to the people who are working there, our team, our partners, and predominantly the labour . Plus, the way we are taking care of the tools and technology for them, which makes their life much better when they 're utilizing those automated tools while they are working out there. So, there is a lot which w e are doing at the current intent, and I think there is a lot more which we intend to do as we grow further at that particular area. But that's one of the reasons of what we have been able to achieve so far, is because of taking care of our labour with the intent and the content like I shared with you.
Anuj Upadhyay : Thank you for this, sir. The last one, just want to check on how the DCR cell efficiencies are working on. We are also hearing from many of other IPPs or developers that the DCR cells are not up to the mark in terms of the efficiency, which is we see acros s the imported cells So, would higher implementation of DCRs going ahead would have any kind of an impact on the targeted efficiency or the generation which we have set aside for our projects?
Raj Kumar Jain : Currently, we don't have those in our portfolio, based on what we are generating right now, especially in Khavda and whatever we are executing. So, it's a hypothetical question for us. But believe me, from a Group where we are, the focus, which is given on quality, I personally will not subscribe to this fact that the DCR products will be anywhere lower in their performance than anyone else. You may say that our cost of DCR may be on the higher side, but for me to comment that the performan ce will be on the lower side, I will not personally subscribe to it with my experience. But having said that, in the current context, we don't have that experience, so not right on my part to comment on it.
Anuj Upadhyay : Fair point. So that's helpful and thanks.
Moderator : We'll take the next question from Siddhant K. Siddhant, please go ahead with your question.
Siddhant K : Hi, sir. Thank you. Thanks for the opportunity. And first, congratulations on great

set of numbers. So, while going through the earnings presentation where I saw the wind CUF which was at 42.3%, which is a very strong number. So, was it because of the earl y onset of monsoon because in monsoon, we usually see higher CUF? And the plant availability factor was at 95.5%. So, this CUF of 42.3%, was it factoring the plant availability factor or it's the total number, like, okay, is it total CUF?
Ashish Khanna : Yes, so I think it is -- first, I would not say that CUF at Khavda has been only because of the early onset of monsoon. I think like we have been saying and I also made it clear at our opening statement that these sites were chosen, and we are very happy f or what we have ch

osen to be, where we are building, what we are building, and what is coming out is the predictable model which is now coming as a reality. As well as your question about availability to the CUF concerned, yes, you must take into consideration the availability factor in place and that's where we are. You also must appreciate the fact that in Q1, the availability also goes low because you have a six-month maintenance schedule for many of our turbines. These are the turbines, and you have those predictable to do too, as well as preventive maintenance systems, which also impacts the overall availability in that quarter. We must be ready for the high wind sea sons per se.
Siddhant K : Okay. So, if it this is adjusted, this CUF is adjusted for the availability factor, then the overall like, net CUF would be much higher than this?
Raj Kumar Jain : So yes, it is adjusted for the availability factor. See, what Ashish was telling is ahead of the monsoon season, all wind turbines in the country have a practice of being overhauled. So that they work on a much better basis in the real wind season, which comes in the monsoons. That's where you will see that availability in this period is slightly lower because it has a monsoon thing .
Second, even the best benchmarks in case of wind, because it is a moving equipment, so turbines have an availability factor of 96 -odd percent to 96.5 -odd percent for the full year because these are moving things and needs more maintenance than a solar plant where availability can be as good as what you see in our thing, which is around 100%. So, that's what the thing is. Yes, mathematically, if you had not taken any maintenance or upkeep kind of a shutdown, yes, the number would 've been higher.
Siddhant K : Great. Thank you, sir. Yes, that's it from my side.
Baiju Joshi : Thank you. So, just to end, I have a couple of questions from my end. First is, on BESS, and I know you talked about it, but I just wanted to understand how you are thinking about this from a five -year perspective, especially when there are other players w ho are quite aggressive on that front.
Ashish Khanna : As we told you, we have a strategy in place and like I said, it's not a 50 -meter run that we are making it across. For us, renewable is a long -term perspective. We are very closely looking at it. W e have investigated the technologies, we have looked into it and we are much better placed than most of the competitors if you see across, with our capacities across India, with the way our plants are performing, and, I'm only saying, hold on to yourself, there is a strategy in place. There is a plan in place. And like I told you, at Adani, we do it at a speed and a scale, which is unprecedented. We should be able to share with you in some time.
Baiju Joshi : Understood, sir. Thank you. Secondly, I wanted to know your thoughts on renewable energy demand from data centers. And just wanted to understand how discussions are going on with these players, especially MNCs, and what kind of contracts you are getting in to and what kind of growth runway you see in that area.
Raj Kumar Jain : Yes, sure. So that's an interesting market and with the way data is being now hosted in India, for India's consumption as well as the new A.I. demand as well as the focus of some of these data centers to have green power, it's a significant opportunity for us. And that's where you see, in our overall mix for FY '30, we have said that 25% of our capacities would be seeing some of these kinds of markets. So, it's pretty much part of our focus area as a potential source of off - take. And there is a keen interest from the -- some of these data centers .
Baiju Joshi : Right, sir. And the contract would be long -term, or do they prefer to procure on spot basis?
Raj Kumar Jain : So, it depends on the buyer and the seller. A lot of these guys who want to do a 10-year contract or a 15 -year contr

act, because that's kind of a visibility you -- they see in their own industry. Obviously, the risk adjusted value which comes to both the s ides needs to reflect that. And that's what happens in some of these contracts. So, spot market is there obviously and there is nothing as a contract. They will secure some short supplies. We are there in that market as well. The pricing reflects the tenur e in that case. So, all of that is something which is a trade of a B2B market. So, I think, as a company, we are ready to take that exposure and that's where we are saying that 25% of the capacity will be available in the merchant exposure, C&I, CFDs, or m ixed hybrid contracts.

Baiju Joshi : Sure, sir. Understood. Very helpful. So last question written in the chat box says, can you please comment on the quarterly swings in the NCI line? How much of the NCI capacity is yet to be commissioned and any timelines for the same?

Saurabh Shah : So, see, out of, 4,500 capacities with Total as a joint venture, about 4,000 -odd capacity has already been commissioned, and another 500 is in pipeline will be commissioned by next six months to one year. So, after that, that swing from that perspective should be minimal except for the di stributions and the other things .

Viral Raval : Just to make it clear, see, the way a renewable profile works is that your profits will keep on increasing as you go towards end of the project life, because your interest cost is higher initially and it keeps on reducing. So, that trend will be followed. But other than that, the 4.5 -gigawatt portfolio that we have under the JV , that will have basically a stable kind of EBITDA . PAT will keep on changing.

Moderator : Thank you, sir. That would be it. Over to you for any closing remarks.

Ashish Khanna : Thank you, everyone. Really appreciate your interest in our organization and the support which you have been providing to us. I think we are very happy with what we have achieved in the Q1, and I think the team is committed to take it further on our overal l target, which we have shared with you about 5 gigawatts and we are on track. Thank you so much for joining us.

Viral Raval : Thank you very much. Please, f eel free to reach out to us for any further questions. Thank you, Baiju, and Macquarie team for organizing this call.
Thank you.

Call: Nov 2025

Dear Sir,

Sub: Transcript of Earnings Call pertaining to the Unaudited Financial Results for the quarter ended September 30, 2025

With reference to above, we hereby inform below link of transcript of the Earnings Call on Unaudited Financial Results (Standalone and Consolidated) of the Company for the quarter ended September 30, 2025 held on October 29, 2025.

Web link to access above transcript is: https://www.adanigreenenergy.com/-/media/Project/GreenEnergy/Investor-Downloads/Results-Conference-Call-Transcript/AGEL-Equity-Earnings-Call-Transcript-H1-FY26.pdf

Kindly take the above on your records.

Thanking You

Yours Faithfully,
For, Adani Green Energy Limited

Pragnesh Darji
Company Secretary

“Adani Green Energy Limited
Q2 & H1 FY '26 Earnings Conference Call”
October 29, 2025

MANAGEMENT : MR. ASHISH KHANNA – CEO
MR. SAURABH SHAH – CFO
MR. RAJ KUMAR JAIN – HEAD OF BUSINESS DEVELOPMENT

MR. VIRAL RAVAL – HEAD OF INVESTOR RELATIONS

MODERATOR : MR. SABRI HAZARIKA – EMKAY GLOBAL FINANCIAL
S ERVICES LIMITED

Moderator: Ladies and gentlemen, good day and welcome to Adani Green Energy Limited Q2 and H1 FY26 Conference Call hosted by Emkay Global Financial Services Limited. As a reminder, all participant clients will be in the listen-only mode and there will be an opportunity for you to ask questions after the presentation concludes. Should you need assistance during the conference call, please signal an operator by pressing star then zero on your touch-tone phone.
Please note that this conference is being recorded. I now hand the conference over to Mr. Sabri Hazarika from Emkay Global Financial Services Limited. Thank you and over to you, sir.
Sabri Hazarika: Thank you, Swapnali. Good afternoon everyone. On behalf of Emkay Global Financial Services, I welcome you all to the Q2 and H1FY26 post-earnings conference call of Adani Green Energy Limited.
We have the company represented by the senior management. Today's session would be brief on the results followed by question-and-answer round. Now I would like to hand over the call to Viral Raval, Head - Investor Relations for the introduction of management and opening remarks. Over to you, Viral.
Viral Raval: Thank you, Sabri. I once again welcome all the participants to our Q2 and H1 FY26 earnings call. With me I have Mr. Ashish Khanna, CEO of the company, Mr. Saurabh Shah, the CFO, Mr. Raj Kumar Jain, the Head of Business Development. We hope you would have got the time to go through our earnings presentation and once Mr. Ashish Khanna finishes his opening remarks, please feel free to ask any questions. Handing over to Mr. Ashish Khanna. Thank you.
Ashish Khanna: Thank you, Viral. Thanks, Sabri. Good afternoon, everyone. I am pleased to announce Adani Green Energy's Outstanding Operational and Financial Performance for the first half of fiscal year 2026, marking another six months of record-breaking growth and execution. Our energy sales rose by an impressive 39% year-on-year, reaching 19.6 billion units. This remarkable achievement is underpinned by strong greenfield capacity additions and operational excellence.
Our renewable energy capacity expanded by 49% year-on-year to 16.7 gigawatts, solidifying our position as India's largest and fastest-growing pure-plate renewable energy company. In H1-FY26, we set a new milestone by adding 2.4 gigawatts of greenfield capacity. This represents 74% of total capacity addition in entire FY25.
We remain firmly on track to achieve our targeted 50 gigawatt capacity by 2030. We are making steady progress in the development of the world's largest renewable energy plant at Khavda, Gujarat, with a 7.1 gigawatt solar, wind, and hybrid assets, including 661 megawatt of group projects already in operation. Adani Green Energy continues to deliver industry-leading financial results.
Revenue from power supply increased by 26% year-on-year to INR6,088 crores, and EBITDA grew by 25% to INR5,651 crores. Our EBITDA margin remains best-in-class at 92%, and cash profits surge by 17% year-on-year to INR3,094 crores. These results are driven by our relentless focus on advanced renewable energy technologies and digitizing our operations.

Our operations and maintenance are powered by sophisticated data analytics, machine learning, and artificial intelligence, enabling real-time monitoring and consistent higher plant availability.
Adani Green Energy's commitment to sustainability and responsible business practices continues to be recognized globally. We rank first in India and seventh globally in renewable energy sector in latest ESG assessment by Sustainalytics.
Additionally, we were honored as Energy Transition Company and Energy Company of the Year in Renewables category at recent ET Energy Leadership Awards. We also received the Best Wind Project Awards fo

r Khavda at recent Mercom Summit. As we look ahead, we remain committed to leading India's energy transition and enabling large-scale adoption of affordable clean energy.
Through innovation, operational excellence, and unwavering dedication to ESG principles,

Adani Green Energy is powering sustainable growth for India and the world. We now thank you for your presence and would be looking forward for your queries.
Moderator: Thank you very much. We will now begin the question-and-answer session. The first question is from the line of Anuj Upadhyay from Investec. Please go ahead.
Anuj Upadhyay: Yes. Hi, sir, and congratulations on a good set of numbers. My first question on the capacity expansions. In the first half, we have already commissioned 2.4 gigawatt and we had guided for 5 gigawatts addition in the first – second half, which is generally considered to be a strong period. So, any probability where we can scale up our guidance for the full year?
And second question is related to the evacuation challenges. If you can throw some light how those challenges are placed as of now, which again gives us a confidence of adding 5 gigawatt plus kind of a capacity?
Ashish Khanna: Thanks, Anuj. I think we are committed to the 5 gigawatt. And I think we would like to first achieve that before saying anything else on the future capacity. There always has been challenges, which I think our team has done a phenomenal job in the first half of this year in spite of heavy rains. And in between, we also have a wall in this particular H1. And we have been on track to achieve 5 gigawatt more, 5 gigawatt in this year.
And if there is anything which can be done beyond it, we will come back to you. But currently, we are directionally wholly committed to definitely achieve 5 gigawatt in this financial year.
Regarding the challenges with respect to evacuation, I think you have to appreciate the fact that these evacuations does not come in a 250 megawatt or 750 megawatt tranches.
It comes generally in a 3 gigawatt or 5 gigawatt tranches or 2.5 gigawatt tranches. So, if you map, if you time that across, then either you first wait for that evacuation to be there and then you build your asset or you build it in a time where you are more or less there when this evacuation comes and take advantage from day one of the same.
In the current context, yes, there have been certain delays from the anticipation which we had and we map it very closely. We work very closely with all those who are involved besides the

Government of India, but all those otherwise also who are involved in this evacuation process. All the stakeholders, we map them very closely. We have a great relationship with them. And we know exactly what is happening out there. And accordingly, we do time our projects too. But like we said, in the current context, there has been a challenge, but that is hardly less than 5% on our total effect as we speak right now.
We do expect another 2.5 gigawatt or more than that coming in this particular H2 of further evacuation. And in totality, if you look out another 9 months, we are expecting somewhere close to 17 gigawatt of capacity coming from Khavda itself.
Now, with these in place, we do not foresee there will be always a challenge of a month or two at max a quarter here and there. But we are committed for our particular installation, our investments and our execution capability. And then further on, we are mapping very closely. And with a few months here and there, I think we are comfortable in the way the evacuation will take place on an overall basis.
Because if you look at it currently, we are focusing more on Rajasthan and Khavda. These are the two places which are where we currently are having our maximum execution of future coming in the next 1 or 2 years. And accordingly, I think we do not foresee a major challenge consider

ing the progress which is happening on ground on this evacuation.
Anuj Upadhyay: Yes, that is pretty helpful, sir. So next question is on the margin side. I believe during the quarter, the margin boosts were largely led by higher contribution from the non-PPA segment, that is your merchants, C&I and the CFD side.
So my sense basically was the merchant realization was down during the quarter, but it largely has been led by higher volume of the merchant which has contributed to the EBITDA. Could you just clarify on this part, sir, how exactly the non-PPA segment has played its role in scaling up the margin here?
Ashish Khanna: No, I do not think so. It is an element of a non-PPA segment per se. You will also realize that when you are talking about merchant, you might have taken into consideration the infirm power too. Now, this infirm power which is being currently sold as a merchant is primarily an add-on to our PPAs.
Now, we are ahead of our commitments and we are selling this majority of this power ahead of and these are add-on to our overall returns because our PPAs are for 25 years once they are operationalized. So our coming ahead of the timeline is helping the organization to add more from the business case perspective and that is where you would have found that vis-a-vis the PPA, the merchant is contributing more. And I think as and when these PPAs get operationalized, they will be converted to the PPA power as then will be reflected on our balance

sheet itself.
Anuj Upadhyay: Okay. And lastly, sir, just can you clarify on the average realization which we got on this infirm or the merchant sales?

Saurabh Shah: So the exact numbers from a solar perspective, the average merchant realization was INR2.1 per unit plus the RECs that we earn on that. So that is another INR0.35 per unit. And from wind perspective, it is INR5.13 per unit plus the RECs. So from that aspect that is how the -- so on an average because we have about 35% of wind as our merchant capacity. So from that aspect, that also helps the boosting the overall merchant realization.
Anuj Upadhyay: Thank you, sir.
Ashish Khanna: Again, we emphasize that the point that these are the add-ons from the point of PPAs, if you look at it. On overall business plan these are helping us to earn more by executing early.
Anuj Upadhyay: Yes, that was my question, sir. So the clarification. Thank you.
Moderator: Thank you. The next question comes from the line of Puneet Gulati from HSBC. Please go ahead.
Puneet Gulati: Yes, thank you so much. My first question is just a bit of clarification on the revenues that you're earning from PPA-based capacity currently sold on merchant basis. You're recognizing it on revenue. You're not capitalizing it. Is that understanding correct?
Saurabh Shah: Yes.
Puneet Gulati: Okay. Secondly, if you can also talk about the progress on the PSP side. How much have you spent so far there?
Ashish Khanna: Well, on the physical progress, we are on track as we have been talking about it. We will be, I think coming out with the first PSP in the shortest time ever possible. The first one is expected to come in the coming calendar year itself and others are also on track. So we are very much on track as well as the execution of these PSPs are concerned. With respect to the exact number on the spent, if you are looking at it, I think the total.
Puneet Gulati: Yes.
Saurabh Shah: See the thing is that our first project, which is at Chitravathi of 500 megawatts of PSP, it's progressing well. It is about 57% odd completed in terms of physical progress. And as such, the overall project cost is about INR2,600 odd crores. So that's how the overall progress has been on that.
Puneet Gulati: Sorry, I couldn't hear. What is the cost you said?
Saurabh Shah: So INR2,600 crores is the overall cost of the project. And out of which physical p

rogress has
been 57%.
Ashish Khanna: So if you look at it, Puneet it is coming at a cost of around INR5.1 crores to INR5.2 crores per megawatt. It's very cost effective that standpoint.
Puneet Gulati: And will it be fair to assume you use it for merchant and there is no PPA?

Ashish Khanna: No, I'm saying, I was just continuing. Since it's a smaller project our larger project of 1800 megawatts, they're even more cost effective on that.
Puneet Gulati: Okay. And will it be fair to assume that this is largely prepared for merchant and there's no PPA at this point of time with this?
Raj Kumar Jain: So, yes, today, as we stand, we have not locked it in a PPA, but we keep that flexibility with us with respect to playing this in the peak power market and extract additional revenue from there.
And at the appropriate time, put that into a contract.
Ashish Khanna: And Puneet, if you ask me on a general question, that is our strategy for all, that wherever we get an opportunity to earn a handsome return on a PPA, the assets are important to be in place.
Once the opportunity comes, we will take full advantage of that particular opportunity to have the maximum return.
Puneet Gulati: Understood. That's very helpful. And if you can also talk a bit about slightly lower PLF on the hybrid side, while both wind and solar have done well on year-on-year basis, hybrid has been a tad lower on year-on-year basis. How should one think about that?
Ashish Khanna: No, I think the -- yes, but I think if you look at it in total, the wind has changed to a little extent in the current context. And I would not be -- if you see from an overall standpoint, yes, it's a few basis points less than -- but a lot of it depends on the weather content itself and where they are placed per se.
Viral Raval: Just to add, Puneet, so hybrid CUF is also dependent on what kind of solar-wind combination

you have. So the new projects have a specific design CUF which is lower. So it is dependent on that also, in addition to what Ashish ji has said.

Puneet Gulati: No, I am just looking at Q2 '25 versus Q2 '26. Solar is higher, wind is higher, PLF, but hybrid is down from 43 to 39.

Ashish Khanna: It is hardly -- if you look at it, we are 39% plus on a hybrid. On that factor too, if you look at H1, right, H1 we are 39% plus, which is a very decent hybrid. A few basis points here and there in this scenario keeps on going up and down.

Raj Kumar Jain: And Puneet, just further elaborating on what Viral was saying, so we have a very intense hybrid when it comes to Rajasthan, where on the 700 megawatt we have 500 plus megawatt of wind and 600 plus megawatt of solar. So that's a very intense hybrid in terms of the power which is going. That was a unique hybrid which we had set up.

The new hybrids which we are setting up are as per the requirements of the respective PPAs where such intensity of solar and wind is not there. So that's where, again, it has to be more specific, seen based on the underlying mix of what hybrids which we are looking at. That's where also the difference is coming.

Puneet Gulati: Understood. That's helpful. And lastly, if you can talk a bit about if you signed any new PPAs during the quarter, there were a few projects which you have won early into this year and late last year. Any progress there?

Ashish Khanna: I think on an overall basis, as we see, today we have LOAs of more than 4 gigawatts with us to be converted into the PPAs. Other than that, around 27 gigawatts are there in the PPAs. I think we are on track. So we looked at on a more holistic basis on how we are moving towards 50 gigawatt target. And every year we have been adding on it. So I didn't get actually what number you are looking at.

Puneet Gulati: No, just any new LOAs which got converted into PPA during the quarter?

Viral Raval: Yes. So in this quarter, specifically, there is no such major development. But on an overall basis, we have converted a lot of LOAs into PPAs in the last six to nine months.

Puneet Gulati: Correct. Understood.

Moderator: The next question comes from the line of Manish Somaiya from Cantor Fitzgerald & Company.

Manish Somaiya: Good morning. Just a couple of questions for me. One on capex. Capex was about 18% higher year-over-year. So maybe if you can just help us understand the cadence of capex spending in fiscal ‘26 and maybe even ‘27. And if you can go beyond that, that would be also super helpful.

Saurabh Shah: So see, from capex perspective, we are the voice for 5-gigawatt of capacity this year, which will translate into a capex of about INR30,000 crores, of which 2.4-gigawatt has been achieved. And accordingly, the capex has been spent. From a perspective of next two years, the range would be in that same INR30,000 crores to INR35,000 crores of capex to be done each year.

Because our plans would be in that similar range in terms of the execution, or maybe going a bit higher as we move forward into the next two years. So that's why the range would be between those numbers of INR30,000 crores to INR35,000 crores, which translates into $4 billion of capex sort of number in that sense.

Manish Somaiya: Okay. That's super helpful. I did see the receivable days improved. And perhaps if you just kind of give us some color on what is that attributable to? Are you having delays in payments from discounts? Maybe if you can just help us understand that improvement and how sustainable is that?

Viral Raval: Yes. So, Manish, if you look at the annexure on receivables that we have in the earnings presentation, you will see that our overdue receivables, which is basically any payment beyond the due date, is only four days, which is what I think is important to track. Otherwise, every DISCOM continues to pay within the due dates. So it is all on track, is what I would say.

Saurabh Shah: And there is no change in the number of days from those perspectives. Last year or last quarter also, it was similar in that sense.

Viral Raval: Yes. So sometimes what happens is when you look at the overall receivables, which you see, what happens is the not due category fluctuates a little bit, but it is not due. So what matters is what is due and then if there is a delay.

Manish Somaiya: I see. Okay. No. That’s helpful.

Ashish Khanna: I'll add on it that, we have been tracking it very closely. So it is important for us to make sure that we get our payments as they are due and not to be delayed. So there is a huge focus on

realization of these payments.
If there is any increment or decrement, if you are seeing on the part of our realization in terms of number of days, is also coming from the fact that our teams are very closely monitoring it. And then our realization is also getting better. So it is a continuous process and I am sure you will see continuous improvement on it, even though it is minor, but our focus is very huge on this.
Manish Somaiya: Okay. No. That is super helpful. And then I was just going through the solar capacity utilization factor, which dipped sequentially. Maybe if you can just allude to why that was and then just connected to it, the delayed Khavda commissioning in 2Q, how much of that capacity has since come online in Q3? So two questions there.
Ashish Khanna: So I think I am not sure where you are looking at this. So if you are only speaking from a Q2, yes, there is always a -- if you see the monsoon, this time has been a bit erratic. Generally, we -
- it is not extended to the level it has and does not even come to that level. So there has been a weather change.
But I think on an overall basis, if you look around, it is not that bad. On an H1 basis, if I look out, in the half yearly CUF o

f solar compared to last year, it is better than that. Of course, the weather changes impact that particular part of it. I did not get your second question. What about this? Can you be a bit more?
Manish Somaiya: Yes. Sure. Sure. No, and apologies for that. So just to clarify, I guess, my understanding is that there was some delayed pertaining to the Khavda commissioning in 2Q. And I was wondering if that impacted capacity in any fashion and how much of that has come online in 3Q?
Ashish Khanna: Manish, I think, let me reiterate what we did in this particular H1. We have been, let me again say that we did -- the company did more or less 74% and close to 75% of what it did last year.
So I think we are doing a great job as well as the execution is concerned. If I look around out in the whole of India, no one would have done 2.4-gigawatt in H1.
And in spite of a heavy monsoon, coming close to more than 800-megawatt and close to 900-megawatt in a quarter is no small thing. Take my word on this as well as the solar and otherwise is concerned. So I think we are very proud of what the team has done here as well as the Q2 is concerned. There are always a scope for improvement.
So we do not get the idea from where you get this idea that we have been delayed in execution of certain projects. Out of a 5-gigawatt which we have targeted this year, we are already more

than 2.4-gigawatt per se. I think we are on track on an overall basis, including on Q2. Q2 has always been a difficult quarter, not only for us, but for everyone else too. And still we did a handsome job.
Manish Somaiya: No. And I appreciate the answer. Again, I just wanted to get some clarification, but you have provided that. And just lastly, on leverage, if you can just help us frame leverage as we sort of go ahead, especially with all the capex needs that you have, the growth plans that you have, how should we think about leverage, not just in fiscal ‘26, but perhaps even a little bit beyond?
Saurabh Shah: So see from a leverage perspective, from a net debt to EBITDA, which we track on a continuous basis, net debt to run rate EBITDA, we, from an operational asset perspective, we are at 4.4 times of net debt to run rate EBITDA. And including the under construction debt, we are at 5.1 times to be exact on the net debt to run rate EBITDA number.
So from that aspect for another two years, three years, because of the kind of capex that we are continuing to do, we will be in the range between 4 times to 5 times of net debt to run rate EBITDA and continue to be there around that. But as we get closer to ‘29 onwards, the number will drastically start to reduce because the capex would have all come on online.
See the other way of looking at this is that today, earlier we were doing 10-gigawatt or 11-gigawatt of operating capacity or 4-gigawatt to 5-gigawatt of construction. Today we are at 17-gigawatt of operating capacity, we are doing 4-gigawatt to 5-gigawatt of construction on a continuous basis.
And that number of operational EBIT number and the run rate EBITDA will continue to grow higher than the debt impact. So from that aspect, the overall number should start continue to go on a downward trajectory and it will fall sharply from ‘29 onwards. Hope I am able to answer that.
Manish Somaiya: Okay. Yes.
Moderator: The next question comes from the line of Mohit Kumar from ICICI Securities.
Mohit Kumar: Yes. Good morning, sir. My first question is on the EBITDA for the current quarter. If you remove the other income, the EBITDA was INR26 billion versus last quarter it was INR30 billion, right? And the question is, we had guided for a run rate EBITDA of INR136 billion for the portfolio which got commissioned by the end of Q1 FY ‘26, right?

Which amounts to roughly INR34 billion per quarter. Of course, this quarter we had monsoon, but is it fair to assume that as we

enter Q3 and Q4, those run rate EBITDA of INR34 billion per quarter will be achieved?
Ashish Khanna: Yes. Definitely, Mohit.
Mohit Kumar: My second question in this particular quarter, I think, there is a slide number 17, slide 17 of the presentation, which talks about the grid availability for the solar in particular has declined significantly, right? It was last quarter, I think, Q1 it was 97%. I show 89%, right? That number

is -- is it that this particular monsoon, there was too much of curtailment in this quarter and we expect this to be corrected as we go forward?
Ashish Khanna: No. I think, Mohit, we have spoken about the curtailment part of it. There cannot be exact timing, but yes, there would be always a month here and there, but we are on a track and on an overall basis on the returns part, we are definitely going to meet and surpass the returns. If you look at the notes below…
Mohit Kumar: The only question, it seems to be very, very high, right, compared to last year, 97%.
Ashish Khanna: No. That is what I am saying. If you look at the notes below, you will realize that this time we have also included the external grid in it. And that is where you have seen differentials from the earlier reporting to this, which has been clarified in the notes too. Now, it takes into consideration external as well as internal grid availability.
Viral Raval: Just to add, Mohit, so this is primarily with respect to new projects which are getting commissioned, which is where Ashish ji explained how there can be a lag between when the transmission comes up versus when I have set up the capacity. But because as he said, the transmission comes up in chunks, it is always better to have your capacities commissioned, right?
So, sometimes because of this reason, the grid availability may show up to be low on an overall basis, but you are still not really compromising on your return, because this is on the new capacities which are running currently as merchant or infirm. I hope that clarifies.
Mohit Kumar: Yes. That helps, of course. I will talk about…
Ashish Khanna: So, Mohit, let me also add since we talk about curtailment and this is the second question, so I thought let us address even future questions which can come about it. We do expect, say in Khavda, by the end of this year, around 10-gigawatt of capacities to be evacuated. And so, that is where we have been speaking about that whatever we are adding into it, we do not, are you there?
Mohit Kumar: Yes. I am there.
Ashish Khanna: That whatever we are adding into it will be evacuated. It is a matter of a timing of few months, few weeks here and there, which is the impact which you have seen there.
Mohit Kumar: Is it fair to expect that what we are selling in merchant under long-term PPAs will get converted into long-term PPA sales by end of this fiscal?
Ashish Khanna: You see, merchant, I would not call it merchant, we call it infirm power. It is the same thing which we are talking about here. It all depends on when the PPAs are getting operationalized. And these PPAs get operationalized at a particular time frame. And I think we cannot say that all of them is going to be operationalized because there are certain elements on the whole evacuation system which are required.

It is not only evacuating from Khavda or from that particular project. The further elements are also required to be operate -- are required to be in place before the PPAs are operationalized. So, they are going to be operationalized in a sequencing manner as we progress in this quarter and next quarter.
Mohit Kumar: My last question, what are the gross block at the end of H1 FY '26? Is it, my number is roughly INR1 trillion. Is that number right, unlike…?
Saurabh Shah: So, in terms of rupees, the overall gross block is at about IN

R1 lakh crores, INR1.1 lakh crores
on the including the CWIP. Without CWIP on a gross block, very specific basis, it is INR94,000 crores plus a CWIP of INR16,000 crores which is to be added to that in terms of under construction projects.
Mohit Kumar: INR94,000 is gross block for all the operational portfolio of around 16.7-gigawatt. Is that

number right?
Saurabh Shah: Yes. Yes.
Mohit Kumar: Understood, sir.
Moderator: The next question comes from the line of Aniket Mittal from SBI Mutual Fund.
Aniket Mittal: Yes. My first question was actually just on the overall tendering sector. We have seen a bit of slowdown this year compared to the past two years. Just wanted your thoughts on that going forward. How do you look at tendering within renewables at a country level for the next couple of years?
Ashish Khanna: I think I will just give two bits before I turn it. I think the important factor, Aniket, is not tendering. It is important factor is how much of those tenders are converted into the power purchase agreement. I think that is an important factor. We are also seeing a shift coming from a pure play solar, pure play wind to now a peak power type of tender where the storage is playing an important role.
And we do foresee more and more of round the clock power, our peak power type which is coming from renewable. Conversion of the current tender, yes, we are blessed not to have many, hardly 4-gigawatt is where we have our LOAs which are going to be converted to PPAs. But yes, on an overall basis, there have been certain tenders which have not been converted to PPAs for some time.
But if you are looking for the next two years, our view is that we will have more tenders coming with the peak power or a storage power as a component to it rather than a pure play solar. And they will, of course, be converted into PPAs per se. Raj, you would like to add?
Raj Kumar Jain: No. I think further that you will see such cycles. You will see a lot of activity happening in a particular year, sometimes a lot of aggression from some of the market players. And then that's slowing down. And then there is a different kind of opportunity, opportunities emerging.

So I think from a maturity angle, Adani Green is very clear in its strategy that it dips into these tendering process when it feels it -- when it realizes that it is right to do and it is allowing us to have higher return projects with us. So we have seen such cycles in the past and have ensured that our strategy is paying off for us.
Aniket Mittal: Got it. In terms of view of that, how do you look at the current competition intensity? We've seen a lot of tenders, like you said, come out on that solar plus storage basis and we tend to be shy of participating in that. So just wanted to understand your view on the competition speed?
Raj Kumar Jain: So I think it's not a question of being shy of participating. And I think our track record says how much contracts we have in hand. It's a question of our strategy, how we want to be in that market.
Now, coming to the first part of your question, in terms of participation, just because the way potentially some of these storage contracts are coming in, the value added can be broken 50 megawatts, 100 megawatts, allows a lot of people to participate and actually be very, very competitive.
The conventional players in these tenders are not necessarily the big participants, because they are seeing some aggression happening in these tenders. But I think it's what the market is. You will see some of these rounds of things happening, things normalizing and the market again maturing.
Ashish Khanna: And if I can add on, Raj, here, the question is not only on the participation part. I think we are on a long race out here. There are enough opportunities for anyone. The important factor is that at what return profile we would like to bid an

d then execute projects. You will also appreciate the fact that we are an organization who invests for a long-term basis and not looking for and not competing with those who are on a platform basis with a 50-megawatt or 100-megawatt wind for very different reasons.
Each organization has very different reasons for what they are doing. There are some smaller players too. And from our standpoint, it is important that our return profile is met wherever we are going. And we do foresee that there are enough opportunities for us to go rather than just dipping us low for the heck of optics.
Aniket Mittal: Got that and that is pretty helpful. Just circling back to the earlier question on grid constraints, would you be able to quantify that? So let's say had these grid constraints not occurred, how much higher would the overall generation be for us in this quarter?
Ashish Khanna: So we have already mentioned that this total impact is actually less than 5%. And that is the impact of all this curtailment which is having on our event.
Aniket Mittal: And the other part of that, so do you quantify some capacity as well? So what's the overall capacity that is being currently sold as infirm power?
Ashish Khanna: Yes.
Raj Kumar Jain: 4,800.

Ashish Khanna: Another 4.8-gigawatt.
Raj Kumar Jain: 4.8 gigawatt is infirm or pre-COD power.
Aniket Mittal: Got it. Got it. I just had one last question on the PSP front. You touched upon the Andhra Pradesh, but just on the UP, what could you give some clarity in terms of how the capex will phase out over there if of any large, that would be helpful to understand.
Raj Kumar Jain: Yes. So I think it has a timeline of six years broadly from the day we signed the PSA. So obviously the capex would be heavy towards the end of last three years. And prior to that, obviously the advances with respect to ordering, etcetera, would go. And obviously there is a capex on the land side, some of the pre-development costs. So that's what is expected in the first three years more and then the real capex would come in. So we don't expect too much of that happening in the next couple of years.
Ashish Khanna: Yes. If you look at the overall cycle too, like Raj said, is initially more on the land and the advances which have to be given for the equipment part. And then we have a continuous civil work which comes. I understood and in the last years when the equipment start coming and we're installing, we again have a swing on the capex. That's a typical you would be knowing about the capex profile for these infrastructure projects.
Moderator: The next question comes from the line of Bharani V from Avendas Spark.
Bharani V: Yes. Good afternoon. Am I audible?
Management: Yes. You are.
Bharani V: Okay. Great. So my question is around our strategy with respect to BESS. If I see our total portfolio that we want to achieve, which is 50 gigawatts, the hybrid component is 5%, which is 2.5 gigawatts. And even in the current portfolio or the under construction portfolio, we are not significantly present in BESS. This question is pertaining to the fact that the recent tenders and looks like upcoming tenders will have a lot of hybrid component, especially with the BESS component.
So I wanted to understand your view. Though you mentioned in the earlier answer that the competition is high, the project size are lower and it's not conducive for a large player for us. But still, is there any strategy around BESS for us which will change our mix of the 50-gigawatt more towards that? That's my question.
Ashish Khanna: Bharani, let me clarify one thing on the part where there was an earlier question about we decided not to win those projects. It's not that we could not have won those projects. Let's be clear about it. It was our decision not to win for the reasons which we started. We could have always done that. We have th

e capabilities.
Regarding BESS, we are developing it and we are knowing our company. It is at a scale which would be unprecedented in our country. Having said that, I think at an appropriate time, we will share with you what we are doing in the current year and in future too on the BESS per se. But

please be reassured in this timeframe that Adani Green is working and developing BESS and also at a scale which I shared with you will be unprecedented in this country as of now.
Bharani V: Okay. So, does that mean that this plan that you are working on is not in the current numbers, that 50-gigawatt?
Ashish Khanna: No. No. It is not. It is not in the current number.
Management: We will come out with a full strategy around BESS in short.
Ashish Khanna: Yes. Right.
Bharani V: Right. Right. So, some color on how the economics work there. Of course, we know the landed cost of storage plus solar, etcetera. If you can throw some light on some economics on the overall BESS storage?
Ashish Khanna: Adani, we told you that the tenders which are there, we decided not to win. It was not that we could not have won. That was a statement. So, you know the numbers which are there in the market. The second point is you have to appreciate the fact that we are so nicely placed, if I look at it from a competition standpoint or our competitive advantage standpoint.
We have solar power available with us. We have our own land where we can always install BESS. So, from strategic standpoint, we are very well placed from any other competitive standpoint, if you ask me.
Regarding the numbers, like it happens or what has happened in the solar module case, the BESS improvement in technology and the pricing is also going down. We are very conscious of it. We

are going to take advantage of it too and we are taking advantage of it. So, we do foresee that
this is the future and we are working very closely with big manufacturers in this particular
category to play a very important role and a critical role as the way we are playing in renewable
pure play segment.
We will be playing a similar role in this BESS category too. But like I said, we will announce it
shortly about our whole strategy towards BESS. We have already shared with you on the PSP
basis on what we are doing on PSP as another form of storage. BESS also we are developing
and we will be sharing shortly.
Bharani V: Sir, okay, loud and clear.
Moderator: The next question comes from the line of Nikhil Nigania from Bernstein.
Nikhil Nigania: Hi. My first question is on the pipeline of PPA signed projects. I wanted to understand the
module sourcing requirements for that. Am I fair to understand that the solar plus manufacturing
PPA, you are still allowed to import Chinese modules and for the Maharashtra PPA, you do not
need to meet the domestic cell module requirement given the timing of those bids?
Ashish Khanna: Yes. Yes, Nikhil.

Nikhil Nigania: Got it. The second, yes, please.
Ashish Khanna: Yes, Nikhil. You are right. Your understanding is correct.
Nikhil Nigania: Understood. And for the merchant solar that you have been adding for that also are Chinese
modules allowed or?
Raj Kumar Jain: So, Nikhil, the way the law of the land is, the bids which happened prior to somewhere early
'21, we are allowed to import Chinese modules. So, that is where our portfolio is and we are
importing there. The bids which happened after that, there we have the requirement of ALMM
after, if those plants are commissioned after 1st April 2024.
So, in all those cases, including Maharashtra and lot of other LOAs which we have in our hand,
ALMM is the requirement. Recently, the government has introduced the requirement for the
ALCM for projects which are commissioned after 1st June 2026. So, any merchant -- any
projects for which the bid

s were concluded few months back and where the ALCM require --
where the -- after that period, whatever the bids are there, they – there we need to have ALCM,
which means cells have to be done in India.
All merchant projects which we are doing from 1st of April 2024 until 1st June of 2026 would
need – can import cells from outside India. And after that, the cells has to be done in India. So,
that is the overall regulatory space and that is where -- that is how we are -- we have planned
our solution.
Nikhil Nigania: Makes sense. So, is that a reason why we see a lot of merchant solar getting added to take benefit
of this and the transmission charge waiver? Is that rational why we are adding much?
Ashish Khanna: It is not only rational for us, but you would have realized it is rational for everyone. In the Q1
before June, there have been major developments and execution of projects and commissioning
of projects to take advantage of the ISTS waiver and that will continue.
Nikhil Nigania: Makes sense. The second question I had was on the curtailment, apologies for bringing it up
again, but just wanted some clarification. The curtailment data we are seeing is in the ancillary
market, it's trashed down volume. So, just wanted to clarify, there is no compensation being
given for this curtailment that we are witnessing?
Ashish Khanna: So, on a PPA, where we have scheduled power and it is curtailed, we get a deem generation as
such.
Nikhil Nigania: Correct. But most of the curtailment, it knows the priority should be temporary GNA only then
the PPA side. So, is it fair to assume the curtailment is being seen primarily on the temporary
G&A side, which is the infirm power or the merchant power?
Ashish Khanna: Yes. That is the fundamental across all over India, which is applicable to all places. But if you
look around and if I say in Khavda too, if that is your point of concern, then there is all around
T-GNA itself. Most of the power which is coming from us and others is on a T-GNA basis. So,
there is no inequality as of now.

Nikhil Nigania: Understood. Understood. Got it. And the last question I had just on the infirm power side, as you
said earlier, the revenues are not getting capitalized in the P&L. And similarly, I am guessing
the financing cost when everything is going to the P&L as well.
Management: Yes. It all goes to P&L.

Nikhil Nigania: Everything goes to P&L. Perfect. Perfect. Those were my questions.
Moderator: The next question comes from the line of Baiju Joshi from Macquarie.
Baiju Joshi: Most of my questions have been answered. I just have a small couple of questions. Firstly, on the partnership that then connects and Google have for the AI data center campus in Vizag. I wanted to understand Adani Green's role in it, since the release specifically highlights the use of renewables. So, any color around it would be great.
Management: I think it's currently too premature to actually give a proper strategy around it. As it evolves, obviously, as a group, we are very rich in terms of providing multiple solutions, including 24x7 power, which can be green power. And we believe that is something which will be valued by this partnership and will be able to support the green ambitions which this particular venture will have.
Moderator: The next question comes from the line of Bhavik Shah from Invexa Capital.
Bhavik Shah: Hello, sir. Actually, I missed the initial part. So, what is the guidance for the current year?
Ashish Khanna: With respect to our project, we are looking at 5 gigawatts. That's what is our commitment.
Bhavik Shah: Okay. So, we are seeing INR30,000 crores of capex of 5 gigawatts, and next two years, we are seeing we'll have around capex of INR30,000 crores to INR35,000 crores. So, for next two years, also, we'll have a similar 5-gigawatt to 6-gigawatt of, say, capacities com

ing up. And more of our capacities will be, say, back-ended in ‘29 and ‘30.
Management: So, exact capacity, we will give this thing during the Q3 or Q4 results. But as such, it will always be going higher as we move forward into the next year.
Ashish Khanna: But you have to appreciate the fact that, the words come cheap. So, we would like to first demonstrate what we are doing, and then closer to the next year, we will have a projection of the coming year also.
Bhavik Shah: Sure. Sure, sir. That is helpful.
Moderator: The next question comes from the line of Siddhanth K from Tusk Investment.
Siddhanth K: Yes. Hi, sir. Sir, I've joined the call a little late. So, can you please tell us what were the merchant prices for this quarter and for H1 compared to last year?
Saurabh Shah: For the current six months, the average merchant price for solar was INR2.1 per unit, and for wind, it was INR5.13 per unit. And within the merchant capacity, about 34% of our capacities

are wind merchant. So, from that aspect, that is how the entire works, what we call from a merchant capacity perspective.
Siddhanth K: So, basically, the split between the solar and wind is 70-30 in the merchant space.
Management: 65-35 would be the closer number.
Siddhanth K: 65-35. So, is it fair to say the blended merchant price will be close to INR3.5?
Management: Yes. Yes.
Siddhanth K: Okay. And sir, regarding the capacity utilization, sir, like this H1, we saw that solar because of obvious prolonged monsoon, it was around 24.5%. So, and the wind was obviously higher. So, on a full year basis, how should we project this number, sir, for solar, and as well as wind on a -- like on a stable basis?
Ashish Khanna: So, if you look out at overall basis, we should be 100-basis-point to 200-basis-point more than the last year. Because if you even compare the H1 solar of last year compared to H1 of this year, I am not going into quarter because weather cannot be determined on the way the quarter works in the calendar year.
But we are definitely expecting 100-basis-point to 200-basis-point more than last year. It is also coming from the fact that our site at Khavda will play a decent role in also enhancing the CUF of the overall capacity. Since our capacities are more and more capacities are coming in Khavda, which has a much better CUF of solar compared to other sites.
Siddhanth K: Right.
Ashish Khanna: Our earlier plan.
Siddhanth K: Yes. And similarly, for solar also?
Ashish Khanna: Yes. I was talking about solar.
Siddhanth K: Sorry, for wind also, sir?
Ashish Khanna: Wind too, we do expect a better one. This time the wind has not been good as of now, from last year to this year. But yes, we do expect it to be on a similar range like last year. Last year has been phenomenally good. We do foresee this year at least to meet that one.
Siddhanth K: Right, because there was a -- on the presentation, it was written that in the Khavda region, the wind touched 42% of CUF this year.
Ashish Khanna: Yes. It has.
Siddhanth K: Okay. Okay. And so my last question is, sir, since the government has stopped doing clean Manila solar tenders, so how much of our capacity is already blocked? Is it like we should be

bothered beyond the 50-gigawatt of target which we have for FY ‘30? Or do we need to consider after the first 30-gigawatts?

Ashish Khanna: No. No. I think you cannot look at all our 50 gigawatts is not all solar or 30 gigawatts is all solar. Our capacity is -- currently there has been a solar PPA, which we are on, which the government is honoring and it is an agreement between the parties, which everyone is honoring and we have placed it.

I think there will be also an element that solar remains the least cost input power. And as and when the time moves on, solar will be more utilized

for an input power for the storage. That is how we will see in the next five years, the movement of solar coming across. More and more, like you rightly said, you would not have a pure place solar tender, but there would be a solar requirement as an input power to all the storages. That remains the least cost option as we have. So let us not discount solar that it is going to go off. We are blessed with the best of solar in this country. And if you look out, our tariffs are the best. We are currently talking of $0.03 or less than that on a solar basis. It is a great source of power, which can be utilized in multiple facets, not only for just providing the power during the daytime, but also for the storage capacity's input power.

Siddhanth K: Right, sir. Right, sir.

Moderator: The next question comes from the line of Puneet Gulati from HSBC.

Puneet Gulati: Yes. On your current capacity, can you share what is the run rate EBITDA? And will it be fair to assume that a lot of capacity which has come in over the last six months is largely the INR2.42 solar one?

Management: Yes. So the run rate EBITDA that we are riding is about INR14,100 crores for the -- from a power sale perspective and…

Puneet Gulati: Okay.

Management: From -- on a world perspective. And the -- majorly, yes, from a solar perspective, that number between INR2.4 per unit to INR2.5 per unit is the number.

Puneet Gulati: Okay. And what is the cost coming for that, those solar plants business?

Management: So, our cost, that is capex, if you are asking, then the…

Puneet Gulati: Yes. Capex.

Management: Capex is basically INR4.5 crores, INR4 crores to INR4.5 crores between that per megawatt. That is the number.

Puneet Gulati: Understood. That is very helpful.

Moderator: Ladies and gentlemen, that was the last question for today. I now hand the conference back to the management for closing comments. Over to you, sir.

Ashish Khanna: I think, thank you for all of you for participating into this. I think we are in a very exciting phase. This particular quarter and in the earlier quarter too, the company has demonstrated its execution and operational skills once again, in spite of some very unprecedented challenges, which we have encountered in this particular half of the year, whether it was a war or unprecedented monsoons, which has struck.

I think we are on a track for our commitment on what we have committed. And like we said, we are also on track for our strategies towards the storage part, whether it is BESS or PSP. We are well committed to execute the 50-gigawatt by 2030. And I think this particular quarter, as well as the last quarter, we are directionally and professionally absolutely right on track. Look forward for your participation in the coming quarters too. And again, a good performance from this company in the coming quarters. Thank you so much.

Viral Raval: Thank you, everyone, for joining this call. On behalf of the management, I would like to thank Emkay Global and the moderator for facilitating this call. And please feel free to reach out to us for any further questions.

Moderator: On behalf of Adani Green Energy Limited, that concludes this conference. Thank you for joining us today and you may now disconnect your line.

Call: Jan 2026

"Adani Green Energy Limited
Q3 & 9M FY '26 Earnings Conference Call"
January 23, 2026

MANAGEMENT : MR. ASHISH KHANNA – CEO
MR. SAURABH SHAH – CFO
MR. RAJ KUMAR JAIN – HEAD OF BUSINESS DEVELOPMENT
MR. VIRAL RAVAL – HEAD OF INVESTOR RELATIONS

MODERATOR : MR. MOHIT KUMAR FROM ICICI SECURITIES

Moderator: Ladies and gentlemen, good day, and welcome to 3Q and 9 month FY '26 Earnings Conference Call of Adani Green Energy Limited, hosted by ICICI Securities Limited. As a reminder, all participant lines will be in the listen-only mode and there will be an opportunity for you to ask questions after the presentation concludes. Should you need assistance during the conference call, please signal an operator by pressing star then zero on your touchtone phone.
I now hand the conference over to Mr. Mohit Kumar from ICICI Securities. Thank you, and over to you, sir.
Mohit Kumar: Thank you, Danish. Good evening. On behalf of ICICI Securities, I welcome you all to the Q3 and 9 months FY '26 Earnings Conference Call of Adani Green Energy. We have with us senior management on the call. We'll start with a brief remark on the results followed by Q&A. I will now hand over the call to Viral, Head - Investor Relations for the introduction of the management and the opening remarks. Over to you, Viral.
Viral Raval: Thank you, Mohit. Good afternoon, everyone. We are pleased to present the results for 9 months FY '26. Welcome all the participants to our earnings call. I hope you would have had the chance to go through our earnings presentation. We have with us Mr. Ashish Khanna, the CEO of the company. We have Mr. Saurabh Shah, CFO; Mr. Raj Kumar Jain, Head of Business Development.
Without wasting any further time, I would like to now hand over the call to Mr. Ashish Khanna for opening remarks, which will be followed by Q&A. Thank you.
Ashish Khanna: Thanks, Viral. Good afternoon, everyone. I'm delighted to share Adani Green Energy's robust operational and financial performance for the first 9 months of fiscal year 2026, underscoring our relentless growth trajectory and industry leadership. Our energy sales surged by an impressive 37% year-on-year, reaching 27.6 billion units. This robust growth is a direct result of significant greenfield capacity additions and strong plant performance.
Our operational renewable energy capacity expanded by 48% year-on-year to 17.2 gigawatts, reinforcing our leadership as India's largest and fastest-growing pure-play renewable energy company and putting us firmly on course to achieve 50 gigawatt target by 2030.
In calendar year '25, we added 5.6 gigawatt of greenfield capacity, which represents nearly 14% of countrywide solar and wind capacity addition. Our landmark Khavda project, the world's largest renewable energy installation, continues to advance at an accelerated pace with an operational portfolio now standing at 7.7 gigawatts of solar, wind and hybrid assets.
We are now on track for deployment of one of the world's largest single location battery energy storage project in coming months. Our hydro pumped storage project on Chitravathi River in Andhra Pradesh is also on track.
Our industry-leading financial results further reflect our operational excellence. Revenue from power supply increased by 25% year-on-year to INR8,508 crores, while EBITDA grew by 24% to INR7,921 crores, achieving an EBITDA margin of 91.5%. These results are powered by advanced technologies and digitized operations, leveraging sophisticated data analytics,

machine learning and artificial intelligence for real-time monitoring, enabling superior operational performance.
Adani Green Energy's commitment to sustainability and responsible business practices continues to be recognized globally. We have been named world's number 1 green utility in the 2025 Global Top 100 Green Utilities ranking by Energy Intelligence. AGEL is top sustainability performer in power generation sector for a second consecutive year in NSE's sustainability ratings. As we look ahead, we remain steadfast in our commitment to India's energy transition by enabling large-scal

e adoption of affordable clean energy. Adani Green Energy is powering sustainable growth for India and the world. Thank you.
Viral Raval: We may now open the lines for questions and answers.
Moderator: Thank you so much sir. Ladies and gentlemen, we'll begin with question-and-answer session now. Our first question comes from the line of Abhinav Nalawade from ICICI Securities. Please go ahead.
Abhinav Nalawade: My first question is grid availability has been low since the last 2 quarters. How much of it has impacted generation for solar, wind and hybrid as well? What would have been the generation if, say, the availability was 100%?
Ashish Khanna: Well, Abhinav, it's a good question. Yes, grid availability has been impacting us, not because of any other reasons, but because the schedules are not being met and there have been delays in the grid augmentation, which is happening. We were expecting in the last quarter, some 2 to 3 gigawatts of augmentation, which has not taken place. However, having said that, as we speak in this month itself, we have been able to augment -- there has been an augmentation of 1 gigawatt, which is helping us, and there is no grid curtailment as far as Rajasthan is concerned on that account.
At Khavda, the challenge remains - we were expecting it to be there in the last quarter that the augmentation will take place, however, as we see in the coming month itself and in this quarter, we are expecting 2 to 3 gigawatt of augmentation from Khavda itself for evacuation of power. I think there would be further augmentation at the end of March by another 1 gigawatt of the lines, which we are closely monitoring as well as their schedules are concerned.
Yes, because of the seasonality and certain ROW issues, there have been delays in the last quarter by agencies who are executing this grid augmentation. But we do expect things to improve in near future.
Abhinav Nalawade: That was helpful. My second question is you're selling about 46% on merchant. So how much of it was infirm power? And when can we expect that to be sold on PPA?
Ashish Khanna: Well, on the merchant aspect, I think there has been -- you see, first of all, let us appreciate the fact that the infirm power on an overall basis of returns is an add-on to what our expectations on return are on day one. So by nature, whatever we earn on it is in addition to what we have envisaged on the return part.

The second aspect is that, yes, in the current (scenario) -- and in our strategy, it has been to maintain around 20% merchant. And then there is infirm power, which is getting -- I think most of it also being utilized once the PPAs are going to be operationalized. In the current context, it has started already coming in, and we do expect in the coming year itself more than 1 to 2 gigawatt of it, which is possible. But having said that, some of it (merchant power) we are also going to utilize in the coming year for our input power for our battery storage, which we have already announced, and that's going to be a big take on that part, too.
Abhinav Nalawade: Okay. Got it. Final question will be as per -- looking at the current capacity of 17.2 gigawatts, what will be a run rate EBITDA?
Ashish Khanna: Can you repeat?
Abhinav Nalawade: Yes. As per our current capacity, operational capacity of about 17.2 gigawatts, what will be a run rate EBITDA?
Saurabh Shah: So for end of FY '26, we are projecting a run rate EBITDA of INR 17,000 crores, including other income of about INR 1,000 crores. And run rate EBITDA from power supply would be about INR16,000 crores.
Moderator: Our next question comes from the line of Bhavik Shah from Invexa Capital LLP.
Bhavik Shah: Sir my first question is I'm failing to understand, like, why is the revenue going down despite our capacity is increasing? Like, I'm thinking like as of September end, we had 16.7 gigawatts

which is operational. So ideally, the entire thing should have been come into revenue in the December quarter, right? So when I just divide the revenue with the operational capacity, it is less than INR0.65 lakh per megawatt. So what am I missing here? Is there some one-off or like there is something which is missing?

Ashish Khanna: Bhavik, you have observed it right. I think it is not missing. It is the seasonality. So there are certain things which have not helped in the last quarter when this capacity has been augmented.

Most important of it is the seasonality impact, which is there. As you would otherwise also be aware of that the wind for that matter has been particularly low in this last quarter compared to whatever we have been considering as such.

Coupled with it, the curtailment impact, which we just shared across, to an extent has also not helped the cause in overall per se. And of course, the market pricing for the merchant power has also been subdued in the last quarter. However, having said that, in this particular quarter, as this year has begun, we are looking at a better market pricing as far as the merchant power is concerned.

And I think the curtailment as I shared with you is also going to reduce substantially with the addition and augmentation of the grid. We do expect better things in this particular quarter, but your observation is very right because of these factors, there has been a dip as far as the revenue realization is concerned.

Bhavik Shah: Right, sir. Sir, just can you throw some light on the curtailment part? Like, why we didn't have this issue in the last quarter? And why is it coming up now in this quarter? So how much is the gap in terms of the evacuation which you are having? And will it like in the next year continue to be there?

Ashish Khanna: You see the curtailment was always there. It was not that there was no impact of the curtailment in the last quarter. One of the things which has helped us in the last quarter is, if you look around, is that the wind has been an important source of our revenues, which has been much better, as you know, in that particular quarter. And wind generally comes on a timing where the curtailment is much less. It impacts solar to a large extent than to the wind part of it.

So it was not that the curtailment was not there in the last quarter. But in this particular quarter, we have been seeing that what was supposed to come in this particular quarter, which we were expecting has been now delayed by 2 months and weeks for that matter. And that is why we have seen a much adverse impact in this last quarter compared to a quarter before. And like I said, we are expecting relatively better as this quarter ends on the curtailment part.

Bhavik Shah: And sir, regarding our interest costs, which has shot up, like, how much of it is on account of, say, the currency depreciation, which you're having? And how much will be actual interest cost if that depreciation would not have been there?

Saurabh Shah: See, we don't have any impact on appreciation of rupee because we are fully hedged in terms of principal as well as interest. So whatever is the mark-to-market that gets generated on interest or currency depreciation gets adjusted out of the hedge benefit that we get. So as such, the interest, whatever the interest cost is, is mainly because of the capacity addition that has come up in the last quarter or in the last 9 months, and that is the interest cost that we are paying. There is no impact that rupee depreciation on this.

Bhavik Shah: Understood. And sir, do you have any guidance for the current year and the next year in terms of revenue and capex both?

Saurabh Shah: So in terms of revenue and in terms of capex, so capex, I'll take first. So we are looking at capex, which will be higher than what we have done this year or what we will be doing this year b

y the
end of Q4. We are looking to grow the capacity by FY '30 to 50 gigawatts. So on that line the capex will continue to be in the range of about INR35,000 crores to INR40,000 crores in terms of capex that we will do for the next year.

And, as such, our run rate EBITDA (as of end of FY26), as I said, would be in the range of INR16,000 crores for power sale and in terms of run rate EBITDA in terms of overall EBITDA would be INR17,000 crores.

So the revenue in that sense at 92% of EBITDA margin that we see. It will be in that same range of INR18,000 crores to INR19,000 crores for end of this year against the run rate EBITDA. But for actual number for next year would be in the -- so if you look at the actual revenue per se, it would be in the range of about INR17,000 crores to, say, INR18,000 crores for next year.

Moderator: Our next question comes from the line of Manish Somaiya from Cantor.

Swetha: This is Swetha here on behalf of Manish from Cantor. My first question is on revenue realization. We see in the presentation that grid availability is down again this quarter. And we want to understand what are the factors that are impacting the grid availability, especially for solar.
Ashish Khanna: Swetha, let me reiterate what I've said. Predominantly, our expansion is coming at 2 places, if you look. One is Rajasthan, other is Khavda. At both these places, there has been an impact on the grid availability per se for our new projects. As I said, in Rajasthan, we have been impacted. But, however, in this particular month, 1,000 megawatts has now been released, and there is no curtailment on that. In Khavda the curtailment remains, and we were expecting 2 to 3 gigawatt (of transmission augmentation), which we are envisaging now, to come in the last quarter itself. Now since there has been a delay as far as the grid enhancement is concerned, that is the impact which has taken place in the last quarter. We also expect that additional 1 gigawatt may be coming by the end of this quarter for evacuation from Khavda. So in a nutshell, what we were expecting of this 2 to 3 gigawatt in the last quarter is what has now been delayed and is now going to come in this particular quarter in the coming weeks.
Swetha: That's very helpful. Another question on revenue was, were there any meaningful changes in tariff mix for the quarter that impacted the revenue per unit of sales?
Ashish Khanna: No, I think there was no change in tariff mix per se, but since the merchant power pricing has been subdued in the last quarter, you would see that the revenue is not in line with what has been there in the past as such. But there's no change in the tariff mix per se. The merchant power tariffs have gone down in the last quarter.
Swetha: One more question on the profitability. We just wanted to understand the breakdown of the margin. And also, how should we think about steady-state sort of operating and maintenance cost per megawatt, especially as the portfolio scales? This is the power supply margin.
Saurabh Shah: So from the perspective of solar, the O&M cost that we take is about INR3.5 lakh to INR4 lakh per megawatt. And in terms of wind, it is INR6 lakh to INR6.5 lakhs per megawatt.
Ashish Khanna: But Swetha, let me add on this. You will appreciate the fact that as we are growing, we have some assets which are of a very small in nature. And obviously, when you average it out, those assets have relatively higher maintenance cost. Now since we are expanding in areas like Khavda and Rajasthan, which have a larger capacity, especially in Khavda, where we are growing with 30 gigawatt at a single location, these costs on an overall basis are also going to reduce as and when we keep on growing our capacities in Khavda.
Swetha: Congrats on a great quarter.
Moderator: Our next question comes from the line of Nikhil Nigania from Bernstein.
Nikhil

Nigania: My first question is on wind. We understand the context on solar. But when we calculate wind PLFs we see them down as well. Would you attribute that largely to wind speeds or again to grid curtailment?

Ashish Khanna: No, no, no, it's absolutely wind speed. Nikhil, it is wind speed, and that's not only for us, but you can look around, the wind speed, particularly in region like Khavda has been the sole factor for our lower PLF at Khavda.
In the last half year -- in the H1, we have seen much, much better wind speeds than what we have experienced in the past. However, in the Q3, because of the seasonal change, we have seen a dip. We hope that things are going to recover on this. But our operational capabilities are the best as of now. We remain the best there. It's only because of the wind speed, which has impacted our PLF or in our terms, we call it CUF.
Nikhil Nigania: The second question I had was the grid constraints are beyond our control, commissioning of transmission lines. So do we see a risk that next year, we would be able to do 5, 6 gigawatt again addition? Or do you think that should not be a challenge?
Ashish Khanna: If you look at it, while I agree with you that grid augmentation is not in our scope. We are very professional as well as bringing our power to the pooling stations -- to the substations at the grid level. Having said that, with the plans which we have seen of augmenting predominantly from Khavda, we do expect another 10 gigawatt to be added in the next year and that is a big plus. And while the expectations or the current forecasting is that it will be added by the end of this calendar year itself, but we are keeping a very close monitoring on it.
The other fact and the factor which is going to help us is huge deployment of battery storage at Khavda. And this, you see that the power going as a -- solar power going as an input to this and then making us realize much better revenue from that stored power, battery storage.
As we have already declared by the end of this financial year, we are going to commission India's largest or one of the world's largest at a single location battery storage project. We also intend to enhance the capacities maybe more than 2x of what we are currently doing in this financial

year, in the coming year.
So there is a great arbitrage which is available with us for infusing this power, solar power co-located with the battery storage and then taking full advantage of the peak power pricing from the storage price. So it is a win-win from both sides. And that will also help us to mitigate the risk of grid curtailments.
Nikhil Nigania: The third question I had was specifically on regulation. We saw CERC release a draft regulation on DSM mechanism tightening while your battery plants, of course, add or solve for that, do you see that getting -- coming in, In some form or another, tighter DSM norms for wind and solar?
Raj Kumar Jain: Yes. So Nikhil, this is Raj. So I think, yes, there is an intention from CERC to make it tighter. Industry has made multiple representations how it is not necessarily suitable for renewable sector where a lot of it is based on what weather is there or what it gives us. So similar thing which is there for thermal cannot be an ultimate goal for renewable.
However, as you have pointed out, for me, as I am augmenting storage at these locations, for me, this is not a challenge. Rather, it's a business case for me for ensuring that I'm able to capitalize on it. So we are not necessarily concerned about this particular regulation too much.

Nikhil Nigania: One last question from my side. We see government come up with these norms of virtual PPAs. You guys have the largest land bank and grid connectivity. Do you plan to participate in those opportunities as well in the C&

I space?
Ashish Khanna: We keep our options open, Nikhil, but it all depends on the profitability on each and every aspect when we go out for these PPAs. We keep our options open on all the opportunities which come.
Moderator: Our next question comes from the line of Mohit Kumar from ICICI Securities.
Mohit Kumar: Sir, my first question is how much battery capacity you are putting up? And what is the tentative time line for setting it up?
Ashish Khanna: Mohit, we have already, I think, shared across that in this particular financial year, we are going to commission 3.5 gigawatt hour of capacity. And like we said that we do expect and we are aiming to add more than twice of it in the coming year. As and when it is finalized, we will share with you.
Mohit Kumar: And sir, do we continue to -- will you continue to maintain this merchant capacity for the medium term, what you're having right now? Is that a fair assessment?
Raj Kumar Jain: Mohit, we obviously take a very opportunistic view on this. As Ashish has mentioned, this helps me in my arbitrage opportunity on storage. This merchant capacity would be able to feed our storage plants in Khavda, and I'll be able to take the better pricing in the evening peak markets with this. So there is a significant flexibility. Obviously, we always keep our options open to deploy this in PPAs where I'm able to make a reasonable return and see this flexibility giving me the highest shareholder value.
Ashish Khanna: And if Mohit, I can add on what Raj is saying, you will appreciate the fact that paramount importance for us is to go at a scale and build projects at a scale, which has the least cost from all parameters which gives us the flexibility as well as the advantage of extracting maximum returns from those assets.
And as you know, Khavda is a case where we are building things at a scale. And then having built up things at a scale, you have the option of co-locating battery storage and other options, too. So there are lots of options available with us provided the returns are more than the threshold, which we have and which is also reflected from our results.
Mohit Kumar: Understood. My second question is, sir, I think, of course, you addressed the curtailment issue. But again, asking in a different way. Are you seeing any curtailment in existing long-term GNA? I'm believing that most of the curtailment is coming in temporary GNA, right? And is it possible to define the impact in terms of -- under long-term GNAs? And is there any compensation for this curtailment under the long-term GNA? That's the question.
Ashish Khanna: Mohit, we are not experiencing any curtailment on a long-term GNA. So it is not right on me then to further dwell on that question, but we are not facing any challenges on the long-term GNA.

Mohit Kumar: Understood, sir. My last question, sir, of course, the government has announced that there is -- they're looking to cancel this 40 gigawatt of solar PPA. I do think that we -- our exposure is very less. But can you please quantify your exposure? And has there been any discussion further? And have you heard anything on that front?

Ashish Khanna: So if you look at much of our exposure is not very high in the 40 GW. And I do believe that this news about canceling the PPAs, let's see where happens. I think on one side, we do believe that there would be by canceling of these LOAs, there would be connectivity released in the system. But on the other side, we all have bid with a certain return expectation and are committed for that price. So while I leave it on to the judgment of those organizations, which has signed the LOAs with us, but our overall exposure on the type of LOAs you are saying is very, very small.
Moderator: Our next question comes from the line of Pradyumna Choudhary from JM Financial Group Investments.
Pradyumna Choudhary: I just had a question r

egarding raw material cost now that they've seen silver prices really going up. So what could be the impact in terms of -- like if you could quantify how much silver contributes to our total cost? And how do we plan on hedging from the same in terms of where the tariff has already been fixed, but the project is yet to be set up completely?
Ashish Khanna: If you look at it, I think there is always -- at the end of the day, these are commodities, which will keep on going up and down. And when we make a business case, we don't take into consideration the lowest cost of commodities. We take a very conservative view on the cost of commodities. And if I now dwell -- go deep into it, the commodities which we are buying, of course, if you look at, about 60% of the solar capex on a project is the module price. We have the advantage in the future to have our own module production. So in some way, we have mitigated the risk of a supply as well as the costing part of it.
Similarly, if you look at it from a wind turbine, majority of the cost comes from a wind turbine in case of wind projects. And there, too, we have our group company manufacturing the India's largest 5.2-megawatt machines and even going for other types, too. So to a large extent, we have this price risk being mitigated in future. And like I shared with you, when we make a business model, we now go by the most aggressive pricing as far as the commodities are concerned.
So returns expectation remains. And let me also reassure to you that most of the projects where we are going ahead, we also tie up the things well in advance so that the contracts are maintained, and we have a certainty of the items which we need for those particular projects.
Pradyumna Choudhary: Okay. Can you just quantify in silver usually what percentage of total cost it contributes in a solar project for us?
Ashish Khanna: Can you just repeat your question? I missed you in between.
Pradyumna Choudhary: How much contribution does silver have in our total cost in a solar project?

Ashish Khanna: So if you see on a largely basis, the module is 55% plus/minus 5% on the overall project. And in a module, my understanding is that it is between 15% to 20% as far as the silver is concerned.
So on an overall basis, it's not going to make or break the light from the module part is concerned.
But yes, these recent increases in the silver and otherwise do impact it on a short-term basis. But these are commodities and whenever we make a business model, like I said, we are very sensitive about what can happen to the commodities rather than being very aggressive about it.
Pradyumna Choudhary: So sir, just to follow up here. Usually, what's the target time line for us like once we -- the time line between the tariffs being decided and our equipment being ordered like the cost for the equipment being decided. Usually, what's the time lag between these 2 things?
Ashish Khanna: I'm not sure whether I have understood your question well, but let me reply to you what I have understood in the process. Pradyumna, if you see, if we are adding 5 - 6 gigawatts in a year. So one of the advantage of having such an amazing speed and the scale of working is that we are impacted less by the commodity variations.
If you are executing a project in 18 months, then the vagaries of commodities generally impact you a lot. Since we are very fast in our project execution, and then more importantly, after execution, taking the revenues out from it so that our revenues come early. That is not the case.
So if I have understood your question in a manner that are we really adversely impacted in a project execution because of this commodity.
Yes, we all are impacted. But since our project execution speed is phenomenally high, and we don't have a typical 18 months period for even 500 megawatts, we completed it in 1 month's time on an ave

rage, if you see across, the impact is much, much less.
Pradyumna Choudhary: Actually, my question was what's the time lag between when we decide -- when we are able to fix the tariff for our project versus when the equipment cost like when we place the order for those equipments what's the time lag between that because that would decide the kind of risk in terms of commodity price volatility we are exposed to, right? So that's what I was trying to understand.
Ashish Khanna: The way we work is that whenever we have a project in place, first of all, we are very clear that,

that project where is the land and where is the evacuation of this thing. So once we have those elements in place, then it is a matter of a project execution. Now if I tell you the project execution time, our philosophy is that the balance of systems because if you look around, as I said, 55% to 60% is the module pricing. We complete the balance of the systems very quickly. We get the modules in place and with our high speed of execution, then we do actually get the revenues out in the quickest time. Like -- if you ask me, on an average, like, I'm sharing with you, if we are executing 500 megawatt of commissioning, we are deploying 500 megawatts of modules in a month's time on an average. So the time period is very short in this particular process.
So it is very difficult to answer your question in a manner that if I go out to get land, if I then start the whole process and then go out for a transmission line and ROW issues, I have one period in place. But since I already have Khavda with us, where I have a land in place, I have

infrastructure in place, I can quickly add on to the transmission line. And only thing which matters is how quickly I can execute the project, our time lines are very different.
Moderator: Our next question comes from the line of Anuj Upadhyay from Investec.
Anuj Upadhyay: Sir, can you just quantify your merchant realization when it comes to both solar and wind for the quarter and comparable quarter for the previous year?
Saurabh Shah: During the current quarter, our solar merchant realization was INR2.20 per unit. And for the last quarter, it was -- for Q3 '25, it was INR2.82 per megawatt per unit. And for the wind, it was around INR3.5 for this quarter, while it was INR4.15 for last.
Ashish Khanna: And let us also add that there RECs on the top of it.
Moderator: Next question comes from the line of Kalpit Sabhaya from GYR Capital Advisors.
Kalpit Sabhaya: So my question is like how strategic will the battery and the pumped storage be in the Adani Green's portfolio over the next 4 to 5 years?
Ashish Khanna: Kalpit, very strategic. Very, very strategic if that is what can satisfy you. We are going to deploy, operationalize and take full advantage of it. We are also having the advantage of an input solar available with us at a time where we can co-locate the batteries as well as the solar projects. The pumped storage, we have already announced. We are on track. And in this particular quarter too, we have announced that our Chitravathi project is on track to come in the coming -- in this calendar year itself. And the work among the other projects is also at a very big pace.
We do believe that renewable power from a stand-alone solar is going to shift towards a point of RTC power where more and more organizations and including the government will look towards a certainty of this power during the peak time or during -- as a round-the-clock power.
And our strategy towards investment and expertise in this particular way will be a differentiator between us and others in this industry. And of course, as you know, we work at a scale which is unprecedented in this country for that matter.
Kalpit Sabhaya: Okay. Okay. And sir, as you mentioned that in the next year around we are planning to capex approximately INR35,000 crores to INR40

,000 crores and approximately INR16,000 crores will be our recurring earnings like EBITDA and all. So for the remaining balance capex, how are we planning? Like, are we going through debt raising? Or what are we planning actually?
Saurabh Shah: See, for us, we are constantly into the debt raising phase because of the under construction projects that we have. A lot of that is already sanctioned for the next year's phasing also because we continue to raise debt at a pace where for the next 9 months to 1 year horizon the debt is already available with us for the next set of requirements. So from that aspect, the sanction of debt for about 9 months are already there in with us.
Kalpit Sabhaya: Okay. Okay. Understood. And sir, like currently, we are already having the net debt of INR76,000 crores. And we had about 9 months of area where we can fulfill our requirements

leading to repayments and interest payment, right? So what is the next expected peak of debt net -- net debt level?
Saurabh Shah: From an operating debt to EBITDA -- run rate EBITDA, we are at 4.6. And from an overall debt to run rate EBITDA, we are at about 5.6 levels. So we see that it is more or less in the same range that we will move along in the next set of 2 to 3 years till we reach the 50 gigawatt capacity.
Moderator: Our next question comes from the line of Surya Narayan Nayak from Sunidhi Securities.
Surya Narayan Nayak: So you said that the -- before setting up the facilities, you would look at the evacuation issues and you start the BOS activities very fast. So that is fine. So you are saying that due to the grid availability issues, the evacuation is not possible and curtailments are actually creating issues as

far as revenue is concerned. So I understand what is the gap that is coming from the understanding of the facilities of the evacuation and setting up the facilities.
So what is lagging because ultimately, it is creating stress on the balance sheet so far as the EBITDA to net debt that is concerned, that is one thing, number one. Number two is that what is the plan of battery storage in the power areas I mean in terms of capacity of the solar to battery storage in terms of banking of the power?
And lastly, in terms of EPC, we have seen that recently, your framework has changed and you have changed giving assignments to outsiders. So what is the intent of that of the shift to expedite the work and -- or let's say or to reduce the cost?
Ashish Khanna: On the evacuation part, like we said that there is a gap and there is a delay, which has impacted us that is there. But you will also appreciate the fact that, say, the evacuation of 2 to 3 gigawatts, which we were expecting in the last quarter you can't build a 2 to 3 gigawatt in 1 day and the evacuation will come.
So we have to time it up. We have to time it up on this factor. You will appreciate the fact that what we are saying 2 to 3 gigawatt in Adani's framework is virtually twice or more than twice by a normal or a top renewable company. So we do things at a scale.
And since we are talking in gigawatt terms and not in megawatt terms, we have to start the work well in advance and take advantage of that on the day the evacuation comes, we should be ready for it. any 3 gigawatt, even with our best in the industry scale of 400 to 500 megawatt a month basically will take 6 months plus or 7 months if we are timing it up after the evacuation has come. So we have to time it up. And there will be always a challenge of on the day it comes, how much we can evacuate and how much we cannot, which is work in progress.
Second point, there is a quarter shift, which we shared with you, which has definitely impacted us in this process. That has been an impact in the last quarter, and we are not hiding it from anyone. It is an impact on us, which we are not liking, but we are hoping that in this parti

cular
quarter, things will pan out as we are seeing.
Regarding your question on the battery storage, we have already said that 3.5 gigawatt hour of battery storage is what we are committed to commission in this particular quarter or in this

financial year. And like we said, we are hoping while the numbers are still being worked out, but our expectation is that we will do more than twice of it in the coming financial year as far as the battery storage is concerned.
So in a nutshell, this battery storage will act as absorbing the power, which otherwise would have been curtailed on a short-term basis because on a long term, we keep on mapping when and how the power is going to be evacuated. But there will be always a challenge on a short-term basis. We cannot take that point away from the business we are in, in infrastructure.
Regarding your question on EPC, yes, we are the best and we continue to remain the best. But we realize that for the scale at which we are going to go for, we do need other EPC -- other contractors too at a scale which can work with us. Frankly speaking, we don't call them contractors. We call them partners who will co-develop these projects with us as partners and take it forward. We have a road map of 30 gigawatt in the next 4 years per se.
And I think it is important that we take advantage of all the best resources which are available in this country to build these projects. Ultimately, by 2030, we are going to be 50 gigawatt, and we need all of the best resources which are available in the country to help and support us on that particular cost while we remain steadfast and our performance till date has shown that it is not because of any other reason, but to augment what we can do to enhance our capacity addition build.
Surya Narayan Nayak: So storage facilities will it be designed for 2 hours or 4 hours?
Ashish Khanna: It is -- you have to appreciate the fact that it is not a design criteria per se. But yes, we are conscious of the fact that it can be extended from that standpoint. Even if you have 3 hours, you can evacuate the power to 2 hours or 4 hours depending on that particular frame. But 2 to 3 hours is what is the generic there, and you can extend it.
Surya Narayan Nayak: So you are saying irrespective of the evacuation challenges the setting of the installations of solar will continue?
Ashish Khanna: We are saying that evacuation is a challenge on a short-term basis. We are timing it up so that we install our solar project in line with what is coming on a long-term basis. However, to mitigate the risk on a short-term basis, battery storage will come very handy in mitigating those risks. I hope I'm clear on our statement on this account.
Surya Narayan Nayak: Okay. And secondly, sir, finally, you said roughly 11% of the project cost is impacted by or that is silver related and which has seen a very stupendous rise of rate. So my question is that whether some of the power -- some of these IPPs, which were stocked and where the DISCOMs were

not showing interest due to the subdued tariff. So will it show some kind of spike in interest because the -- then the cost of projects will also go up, so as the tariff may also have some sort of upward trajectory movement maybe in short term. So will it spike interest and it will remove the -- even it will impact the merchant tariff in our case?

Ashish Khanna: So I think if there is a shortage of power, it will improve the merchant tariff in our case, for sure. Having said that, I think we have to look for when we are signing a 25-year PPA, it has to be a

win-win for both the parties. I don't think so that DISCOM are just holding it up because of the pricing part. There was a challenge with that.

And again, this 42 gigawatt was bid without any backup as far as the offtakers are concerned.

And I think that's a challenge in the whole system. You first bid the project, you get a price and then you go to the offtakers for that particular price. A silver pricing, which is a critical component in a module to change the whole dynamics, I'm not very sure that's the right way to put it across.

Moderator: Our next question comes from the line of Abhinav from ICICI Securities.

Abhinav Nalawade: Just a final question on overall industry. I mean we're seeing a slowdown this year compared to the past 2 years in terms of tendering. What are your views on tendering within renewables for the next couple of years?

Ashish Khanna: You're talking from our standpoint or from an industry?

Abhinav Nalawade: Overall industry standpoint.

Ashish Khanna: I think in the industry, there has been a realization that like we have been said in this call itself that there are 42 gigawatts of I would say, LOAs but not translated into PPAs and PSAs. So I think there is a backlog out there. I like to believe that -- it is not a matter of one particular way. When we talk of renewables, we should look holistically taking into consideration the storage, taking into consideration wind, taking into consideration solar, which can be utilized for input to storage, whether it is pumped storage or it is battery storage.

And I think it is important that we look at the whole thing very holistically. I also do believe that there could be some, I would say, rather than the central grid to be utilized, the state grid can be utilized and tenders can come from a state too, where they have connectivities on the STU level, which can be connected and which will not be impacted on that way. I think there are many aspects which are very dynamic in nature today as far as LCAM is concerned, which is going to come up as far as this untied capacity is concerned as far as new evacuation capacities are concerned.

And in any case, there are commodity pricing, which is going to impact the tariff per se on a short-term basis. But when you look at renewable per se, I would suggest that we should look into a holistic manner on a long-term basis for a solution, which is good for the buyer as well as for the seller. In this particular case, developer as well as the procurer. And I think a stage has come where the peak power tenders, the RTC tenders are going -- we will see more of them rather than a pure-play solar tenders per se.

Moderator: Our next question comes from the line of Pradyumna Choudhary: from JM Financial Group Investment.

Pradyumna Choudhary: Sorry, just beating around my previous question a little more. So like you spoke about there being a 12-month time line between a project being executed, being actually commercialized.

So -- and silver prices during this time have actually gone 3x. And again, silver for our projects is around 10%, 11% of the total cost.

So what does it really do to our IRRs of these projects, right? These are anyway 15%, 16% IRR projects. So how do we really deal with it? Is there a way to -- is there a way to pass on these prices because otherwise, the IRR really takes a hit, right? 3x increase in a commodity contributing 10% of the cost increases our total project cost by quite a bit?

Ashish Khanna: I don't know why you're saying we are not answering it very clearly. Let me answer it very clearly. And if you're not clear, do say it rather than a subsequent question. What we have said is, when we bid the project, always take into consideration the vagaries of commodities. We have bid these projects a long time back, not at the current stage itself. At any stage, we have a clarity on what can go with the commodities because it remains a commodity.

To the extent we can hedge, it's one matter, but we take that into consideration on our return expectation. That is why you will appreciate the fact that whenever you see t

he tenders being
bid and all those factors, you will not find us at a certain level, which people question as well as the tariffs are concerned. So we are very, very conservative in our costing. We are very focused on our return expectation. And when we bid the project, that is the time we are going to buy that particular element.

Now today, well, the silver has gone up. But in the past, the silver was not that up. And in future, too, there is no guarantee that silver will remain at this particular level, which will further impact the module pricing. At the time when -- again, I'm saying at the time when we are buying it, we'll look at it. But at the time when we are bidding, we are overly conservative on our commodity pricing, particularly in this field because there are -- these are primarily commodities per se.

So price at a higher rate, yes, ideologically, the returns should be impacted. But since we are conservative on that particular cost, it is still a very different and a decent level of returns, which this project gives to us.

Pradyumna Choudhary: So like I understand that we will be conservative in the price range. But at the same time, we wouldn't have accounted for a 3x increase in silver, right, during this period. So like no one would have, right? So there, how are we really -- and my sense is modules are amongst the last equipments to be ordered, like just before the project is being completed is when modules are really ordered, right? So then how do we really account for such projects?

Ashish Khanna: Yes, yes, I can answer you on one part. I'll also ask Raj to further help you. Somehow, I think I'm not getting that clear to you. The fact remains that if you are in the industry, then around 4 years back, there are certain module pricing. Sometime back, if you look at the cell price at that particular time or the module prices 1.5 years back, was even less than the cell pricing, which was quoted a few years back. You do take advantage of those situations too when the prices go dramatically down.

However, like I said, these are projects where you make profits. At a particular time when the commodity goes up, there is always a dent on the return. However, if you are conservative at

that particular time, you make a better return. And if you are conservative at the time of bidding per se and your returns expectations are higher than the normal, you also make a decent return on that too from an industry standpoint. Raj, you'd like to add on to this?

Raj Kumar Jain: I think, Ashish, you have been very clear. And again, just to bring it to the light, the recent module prices, which you saw in the last year were the lowest in the history of module pricing. And obviously, in case of our portfolio, we have almost all our bids, which are at a price where we had factored in much higher module prices as well as built in relevant risk framework where we had discounted them with those potential vagaries in the various factors, whether it is modules or other considerations.

So yes, obviously, if the module prices go up, it will increase the cost for the developers, including for us. But it is a question whether you have factored in. If people have gone very aggressive based on last year prices and they have won something, they may face certain issues, but that is not the case with Adani Green.

Pradyumna Choudhary: Understood. And my last question is, what are the -- like if you could just tell us how much increase in module prices are you seeing currently on a Y-o-Y basis compared to same time last year? What were the prices then and what are the prices now that you're seeing?

Ashish Khanna: Yes. So yes, it's around 10%, which we are seeing. I think you have to appreciate the fact - do you have a long-term relationship with the suppliers. At what scale one is buying. What is the relationship with those particular

suppliers which you have, which country you are buying from,
what are the capacities which are available there at that particular time.

So it's not an apple-to-apple comparison per se. There are things which changes across. We do -- we have been seeing an increase in the recent past of around 10%. But at the end of the day, they are commodities. They can go up and down in that time. Some people are even reporting slightly more. But that's up to the individual company when and how they buy it.

Moderator: Ladies and gentlemen, due to the interest of the time, that was the last question for today. I would like to hand the conference over to management for the closing comments. Thank you, and over to you, sir.

Ashish Khanna: So I really appreciate all those who have participated in the call and are being closely monitoring our organization, I think it is the most exciting time for us. There have been challenges which we openly and transparently have been sharing with you with respect to the transmission line constraints, the augmentation, which was expected to come on that delay. There has been some subdued market pricing as well as the solar price is concerned. And of course, the weather has not helped us, but these are very seasonal in nature.

And I think on the overall industry part, we have to give it a longer time frame than a quarter on that. The fact remains that our EBITDA margins and our costs remain -- the EBITDA margin remains the highest in the industry and the cost remains lowest. Our expansion is going on.

We are very excited about our storage solutions, which we are adding at a great scale, which I said is further going to derisk some of the challenges which we have been facing with respect to pricing as well as with respect to evacuation constraints.

It's a very exciting time for us. Q4, we are very excited to further add up and then reach the commitment of an expansion in this particular year, which we have already committed. We are very excited to reach that. And of course, Adani Green will remain as number 1 renewable company in this country from all aspects. Thank you once again for joining this call and of course, organizing it.

Viral Raval: Thank you very much ICICI Securities for helping organize the call. And thank you all the investors and analysts for joining this call. Please feel free to reach out to us for any further questions. Thank you.

Moderator: Thank you so much, sir. Ladies and gentlemen, on behalf of ICICI Securities Limited, that concludes this conference. Thank you for joining us, and you may now disconnect your lines.

statements.
Moderator: Ladies and gentlemen, good day and welcome to the Adani Green Energy Limited FY26 Fixed Income Earnings Conference Call . As a reminder, all participant lines will be in the listen -only mode and there will be an opportunity for you to ask questions after the presentation concludes. Should you need assistance during this conference call, please signal an operator by pressing star then zero on your touchtone phone.
I now hand the conference over to Mr. Aayush Gulati from Standard Chartered Bank . Thank you and over to you.
Aayush Gulati: Thank you, Steve. Good morning and good evening, everyone, depending on which part of the world you are in today. I am Aayush Gulati on behalf of Standard Chartered Bank. I welcome you all to this FY26 earnings call. The management will initially share their remarks followed by a Q&A session.
With us today we have Mr. Sagar Adani, Executive Director; Mr. Ashish Khanna, CEO; Mr. Saurabh Shah, CFO; and Mr. Vijil Jain , Head of Investor Relations. With this, I would like to hand over to Mr. Sagar Adani for his introductory remarks. Mr. Sagar, over to you.
Ashish Khanna: Hi, this is Ashish. So, Ayush, thanks for that. Good afternoon and good evening to everyone. Globally, energy security is the defining priority for most economics. India has made a strategic pivot in this direction, which is evidenced in the scale and speed of the green electrons production in the country.
In the fiscal year '26, the country witnessed highest ever renewable energy share in electricity generation and also achieved a record non -fossil capacity addition of over 55 gigawatt . With this, India has achieved around 283 gigawatt of non -fossil capacity which is installed, and the country is well poised to achieve 500 gigawatt goal by 2030.
At Adani Green Energy, we are proud to be leading the country's energy transition. Our robust operational and financial performance for the fiscal year 2026 demonstrates our unparalleled execution capability and sector leadership. Our energy sales surged b y an impressive 34% on a Y-o-Year basis, reaching 37.6 billion units.

To put this into the right context, this is nearly the annual energy consumption of some of the European countries as a whole. This particular growth was driven by significant greenfield capacity additions and strong operating performance at each and every plant of Adani Green.

During this year, we added 5.1 gigawatt , which is 35% on a Y-o-Y growth, and the cumulative capacity now st ood at 19.3 gigawatt , which is our operating portfolio. This is the highest greenfi

eld annual capacity extension globally by
any company outside China. This further consolidates our leadership position in India's renewable energy sector, putting us firmly on course to achieve 50 gigawatt by 2030.
Notably, our landmark Khavda project, the world's largest renewable energy installation, continues to make a considerable progress with around 9.4 gigawatt of solar, wind, and hybrid assets already in operations, including our group capacities.
Within Khavda, we also added 1.4 gigawatt hour of battery capacity. This is one of the world's largest single -location battery energy storage project. With pump hydro storage projects, we are also making noteworthy progress and are slated to complete our maiden 500 megawatt project at Chitravathi in Andhra Pradesh in this fiscal year.
Our consistent effort towards adoption of advanced technologies, digitization, and leveraging sophisticated data analytics for predictive maintenance has enabled us to deliver exceptional operational performance.
Our industry -leading financial results further reflect our operational excellence and scale advantage. Our revenue from power supply increased by 22% year-on-year basis to INR11,602 crores and EBITDA grew by 23% to INR10,865 crores. This EBITDA margin amounts to 91.2%.
One of the highlights on the capital management side was Japan Credit Agency rating assigned Adani Green an inaugural rating of JCR BBB+ with stable outlook, which is equivalent to India's sovereign credit rating. This clearly demonstrates Adani Green Ener gy's ability to sustain its growth while maintaining financial discipline.
Adani Green Energy's commitment to sustainability and being a responsible business practice partner and following the practices continues to be recognized globally as well as in India. We received many awards which were bestowed on us, including Energy Int elligence Group Top 100 Green Utilities,

and we secured ESG 1+ rating from CareEdge with the highest score of 87.3 by any company in the country.
Further, I take pride in sharing that Adani Green's 19.3 gigawatt operational portfolio will power more than 8.7 million homes and avoid approximately 36 million tons of CO_2 emission annually. The continued recognition of our ESG efforts reaffirms our commitment to sustainable growth and accelerating India's energy transition.
We at Adani Green Energy are committed to continue with our similar level of greenfield capacity additions going forward and are constantly strengthening our organizational and partnership ecosystem to achieve the goal of 50 gigawatt by 2030. Thank s once again for participating in this call and we look forward for your queries.
Moderator: Thank you. We will now begin the question -and-answer session. The first question comes from the line of Aayush Gulati . Please go ahead.
Aayush Gulati: Hi, thank you management team. Just wanted to check on the capex targets for FY27, specifically regarding the greenfield capacity plans of AGEL and also around the plans around the battery capacity in Khavda. Along with that, I would just like to understand a bit more on the funding plans for the capex and especially regarding the average cost of debt and the maturity ? So just wanted you to highlight more on those.
Ashish Khanna: I think it’s a great question in this context . We are already very close to a 3 gigawatt hour of a capacity as far as the battery storage is concerned, which is virtually equal to all the battery storage capacities in this country as we stand.
Our plan is to add in the same rate and by the end of this year to add 10 gigawatt hour of storage capacit ies in Khavda.
With respect to overall capacity addition, we have already demonstrated that we are in a position to add anywhere close to 5 GW plus capacities . However, in view of the evacuation constraints and how the

market pans out with respect
to transmission lines and further consumption at their end, we are currently
planning to add 4.5 to 5.0 gigawatt of our solar and wind capacity. However, it
all matches out with the evacuation capacities which come up.
And like I already said, we have demonstrated our capabilities to install
capacities and if there are opportunities, we will go further in the coming years.
But as we see the current evacuations which are slated to come in this fiscal
year, we feel this will be optimum to be aligned with the evacuation which is

available from a solar, wind, and hybrid perspective. From a battery storage,
we are likely -- we are planning to end 10 gigawatt hour capacity and like I
already mentioned, the pump storage of 500 megawatt will also be coming in
this fiscal year.
Moderator: Thank you. As there are no further questions from the participants, I would now
like to hand the conference over to Mr. Ashish for closing comments .
Ashish Khanna: We once again thank you for participating in this call and looking forward for
your continual support in our growth. Thank you so much.
Moderator: Thank you. On behalf of Adani Green Energy Limited, that concludes this
conference. Thank you for joining us and you may now disconnect your lines.
Thank you.

Moderator: Ladies and gentlemen, good day, and welcome to Adani Green Energy Limited Q4 FY26 Earnings Conference Call hosted by JM Financial Institutional Securities Limited. As a reminder, all participant lines will be in the listen -only mode and there will be an opportunity for you to ask questions after the presentation concludes. Should you need assistance during the conference call, please signal an operator by pressing st ar then zero on your touch -tone phone.

Please note that this conference is being recorded. I now hand the conference over to Mr. Sudhanshu Bansal from JM Financial Institutional Securities Limited. Thank you, and over to you, sir.

Sudhanshu Bansal: Thank you, Iqra. Hello, everybody. On behalf of JM Financial, I welcome you all to the Q4 FY26 earnings call of Adani Green Energy. For today's call, we have with us the leadership team of Adani Green, led by Mr. Sagar Adani, Executive Director; Mr. Ashish Khanna, CEO; Mr. Rajat Seksaria, CEO, Battery Storage; Mr. Saurabh Shah, CFO; and Mr. Vijil Jain, Head I R. Before we proceed, I would like to congratulate whole Adani Green family under the leadership of Mr. Sagar for phenomenal performa nce.

More than 5 gigawatt of the capacity addition in 1 year is truly remarkable, more so when it is across the technologies, be it solar, wind and the hybrid. Congratulations to all the team members. I would like to hand over now to Mr. Sagar for his opening remarks, after which we will open the floor for the Q&A session. Thank you so much, sir, for your kind presence and giving us the opportunity to host the call. Over to you, sir.

Sagar Adani : Thank you very much for setting up the call for us. Good afternoon, everyone. Globally, energy security is the defining priority for economies all over the world today. India has already made a strategic pivot in this direction . And that is already evidenced in the scale and speed of green electron production in the country. In FY26 , our country witnessed the highest ever renewable energy share in electricity generation and also achieved a record non -fossil fuel capacity addition of over 55 gig awatts.

With this, India now has about 283 gigawatts of non -fossil capacity already installed and the country is well on its way to achieve 500 gigawatts by 2030. At Adani Green Energy, we are proud to be leading the country's energy transition. Our robust operational and financial performance for the FY26 demonstrates our unparalleled execution capabilities and sector leadership.

Our energy sales surged by an impressive 34% year -on-year, reaching 37.6 billion units. Just to put this into context, this is nearly the annual el ectricity consumption of

many European countries as a whole. This growth has driven by significant greenfield capacity additions and strong operating performance at our plants.

During the year, we have added 5.1 gigawatts, a 35% year -on-year growth with a cumulative 19.3 gigawatt operating portfolio today. This is the highest greenfield annual capacity expansion globally by any company outside of China. With this, we further cons olidated our leadership position in India's renewable energy sector, and that's put us very firmly on course to achieve 50 gigawatts by 2030.

Notably, our landmark Khavda project, the world's largest renewable energy installation, continues to make considerable progress with 9.4 gigawatts of wind, solar and hybrid assets already operational in that location. Within Khavda, we have also added 1. 4 gigawatt hours of battery capacity in the last year. This is one of the world's largest single location battery energy storage project.

On the pumped hydro side, we are making noteworthy progress, and we aim to complete our maiden 500 -megawatt project at Chitravathi in Andhra Pradesh in this coming year. Our consistent efforts towards adoption of advanced technologies, digitization and le veraging sophisticated data analytics for predictive maintenance have enabled us to deliver an exceptional operating performance.

Our industry -leading financial results further reflect our operational excellence and scale advantage. Revenue from our power supply increased by 22% year -on-year, ending at INR11,602 crores, whilst our EBITDA grew 23% to INR10,865 crores. We achieved an EBITDA margin of 91.2%.

One of the very significant highlights on the capital management side was last year, the Japanese credit rating agency assigned Adani Green an inaugural rating of BBB+ with a stable outlook, which is equivalent to India's sovereign credit rating. This demonstrates Adani Green Energy's ability to sustain its growth while maintaining fiscal discipline at the same time.

Adani Green Energy's commitment to sustainability and responsible business practices continues to be recognized globally and in India. We've achieved top ranks in all the ESG platforms and benchmarks comparable globally. Further, I take pride in sharing that Adani Green's 19.3 gigawatt operating portfolio will power more than 8.7 million homes and will avoid about 36 million tons of CO2 emissions annually.

We are committed to continuing with a similar level of greenfield capacity addition going forward, and we are constantly strengthening both our organizational ecosystem and our partnership ecosystem to achieve our goal of 50 gigawatts by 2030. Thank you, everyone, and we'd love to open up for questions.

Moderator: The first question is from the line of Manish Somaiya from Cantor.

Manish Somaiya : Congratulations on a strong fiscal '26 and best of luck for '27. Couple of questions in my end, if I may. First, Sagar, you talked about the BESS impact as you grow the

operational side from 1.4 gigawatts to 10 gigawatts by '27. If you can just help us understand some of the milestones to getting there, supply chain dependencies, grid connectivity, what is it going to take to ramp to that level in '27? And how prepared ar e you?

Sagar Adani : So Manish, from our point of view, at least even where we stand today, we -- even in the last 30 days of this month, we've added a significant amount of BESS capacity in Khavda. So we hope that in the next few days, we should reach the mark of 3 gigawatt hours of installed capacity in Khavda by sometime in the next week.

So, our capacity ramp -up and addition on the battery side has been very significant so far and is very robust. The only sensitivity we see with that is the capital flexibility to be able to fund the growth

of batteries and to be able to have the organizationa l capability to manage the supply chain. These are only 2 sensitivities. Batteries are delinked with pretty much everything else. In fact, batteries operate as a hedge to the lack of grid availability.

So, if there any issues with regards to grid availability or curtailment, adding more and more capacity of battery storage, in fact is a hedge against that because batteries absorb a lot of the generation and help provide it later in the evening. So basically, what

we've done in the last year is we've added about 3 gigawatts of batteries pretty much, so to speak, in the last 3 to 4 months in effect.
So if you look at the run rate quarterly of about 3 gigawatt hours or so that we have already achieved and we are constantly committed . And we are very comfortable that we will continue to be able to maintain, achieve and probably only make better and increase going forward. That should comfortably put us in a 10 gigawatt hour plus range of being able to add those many amount of capacities in a given year. And that is what our target remains as well as we move forward.
Manish Somaiya : Right. Okay. And then just related to that, how should we think about battery economics versus core solar wind portfolio in terms of EBITDA margin, capital intensity and payback period?
Sagar Adani : From a return economics point of view, we think that batteries give similar to or in fact, in many cases, slightly better. Obviously, there's a market -related element because we discharge capacities from our batteries many times in the evening peak and the rates in the evening peak also contri bute to how the economics work . So, there are 1 or 2 inputs that are outside driven. But from an overall capital intensity versus returns .
We basically look at funding our BESS portfolio at about INR1.5 crores per megawatt hour. That's the range at which we are setting up our future capacities. And we think that at a very comfortable level, we should be able to get about INR 25 lakhs of EBITDA per megawatt hour from a thumb rule perspective.
Manish Somaiya : So these economics are similar or slightly better to what we get on the renewable side as well?

Management : No different.
Manish Somaiya : Okay. That's super helpful. And then just lastly...
Sagar Adani : You obviously also might be aware of some issues that have been related to curtailment, which has affected AGEL and many other companies in the country. So the power that is curtailed today goes completely to waste. So when you put a battery storage capac ity, you use otherwise wasted power, which has today 0 economic value into the BESS, making the cost of input very, very low.
And hence, for a limited time perspective, the margin is significantly higher. So you also have these periods and opportunities and windows of certain months here and there where there may be -- may or may not be some curtailment issues, in which case, th e economics of batteries improve even more dramatically.
Manish Somaiya : Okay. No, that's super helpful. And then just lastly, as we look at fiscal '27, how should we look at or think about the blended revenue per unit and realizations. And just, I guess, if I can connect the second piece to it, how should we think about merch ant versus C&I exposure?
Sagar Adani : Our average blended PPA rates across the board are about INR 3.10. And when we go forward, we're looking at contracting additional solar capacity around the range of about INR 2.60 to 2.8 0, and we're looking at contracting additional wind capacity around the range of about INR 3.70 to 3.80. So that's the range at which AGEL has visibility to be contracting its upcoming capacities.
And obviously, that falls very comfortably within the profitability and return threshold that AGEL expects to deliver going forward. When you look at

it from a C&I perspective,
what AGEL has taken a principal call is that AGEL is not directly coordinating or participating in opportunities for C&I. There is a sister company at the group level, which is called Adani Energy Solutions Limited.
That is the listed company that interfaces with C&I customers. AGEL and AESL have an agreement at the back end where AGEL will contract capacities with AESL at market -driven rates between 2 listed companies. And basis the rates that AGEL gives AESL, AESL goes forward and contracts those capacities with the C&I customers directly.
Moderator: The next question is from the line of Mohit Kumar from ICICI Securities.
Mohit Kumar: My first question is, sir, what is the loss in EBITDA in FY26 due to lower availability and lower prices realized compared to long -term rates for the infirm power we were selling.
And what could have potential EBITDA for the entire fiscal ? If it is possible yes?
Sagar Adani : Yes, please. So we've lost about INR 500 crores of EBITDA in the past year on account of curtailment. And if you look at the rate at which we're looking at contracting our merchant capacity this year going forward versus the realization that we had in the past

year, the loss would be in the range of somewhere between INR 800 crores to INR1,000 crores.
So, we would have lost a total of somewhere between INR1,300 crores to INR1,500 crores of EBITDA in the past year, which we do not expect to be happening going forward as we move in the coming year and the years after that.
Mohit Kumar: Understood. Sir, my second question is, of course, you will again commission 5 to 6 gigawatt in th e coming fiscal. How are you seeing the on the ground transmission connectivity coming up, especially in Khavda? My question is whether do you think the infirm power is just sitting right now will completely get transferred to long -term PPAs in the next fiscal? An d how do you resolve for the new capacity which is coming up?
Sagar Adani : Mohit, very good question, very good questions rather, and I'll try and answer all of them. Basically, today, our capability as an organization is to be able to execute a capacity of around 7 to 8 gigawatts per year. Even today, if AGEL wish, it has both the financial flexibility as well as the organizational capability to execute somewhere between 7 to 8 gigawatts in a given year.
We are stopping our execution at a number of about between 4.5 to 5 gigawatts , looking at the transmission and evacuation constraints that we expect to happen going forward because unlike the past year, what the mistake that we do not want to repeat going forward is to have capacities coming up and then evacuation not being suffici ently available. So that is something we are very cognizant of and our capacity addition plan makes sure to factor for that completely.
An additional thing that is also affecting this in a very significant way is the quantum of battery storage that we're adding in this coming year. Because obviously, again, as I said in the beginning, the hedge to non -availability of transmission is the commissioning of battery capacity , so that the batteries can absorb the power being generated during the day and evacuate it at peak hours during the evening.
We are in the process of very significantly ramping up our capacity addition for batteries. We expect to commission north of 10,000 megawatt hours or 10 gigawatt hours in this coming year. So that's a very, very substantial battery addition that AG EL is in the process of executing as we speak.
And looking at both of these things, we don't expect there to be any significant evacuation constraints for us as the year moves on. And sorry, your question about converting the merchant power or the infirm power into long -term PPAs. Yes, AGEL has a publ ic commitment, and we've always ma

intained that very clearly from our side
that AGEL will always look to and will always endeavor to make sure that the capacity that it is setting up are always a significant majority of them are tied up in long -term contra cts.
Obviously, last year was an anomaly because as all of us know, the ISTS benefit was going away. So we wanted to make sure we add as much capacity as we can on the

ground before the ISTS benefit goes away so that these capacities can enjoy the ISTS benefit for the next 25 years. So obviously, we had a short -term price to pay for that, but it's a very massive benefit for us in the longer term.
And from this year onwards as well as going forward, you will see that our long -term stated goal remains that more than 90% of the capacities that AGEL adds will be tied up in long -term PPAs and long -term contracts.
Mohit Kumar: My last question, if I can ask. Can you just talk about the quantum of battery in terms of megawatt and megawatt hour and number of cycle you're looking to run and capital costs likely to incur in FY27 for the batteries?
Sagar Adani : Yes, we'll be adding north of 10 gigawatt hours of batteries by end of this year . We are setting up our batteries in a 3 -hour configuration. So that would be about 3.3 gigawatt equivalent of dispatch capacity, multiplied by 3 hours equivalent to about 10 gigawatt hours or north of 10 gigawatt hours.
We have the flexibility to design our plants both between 2 hours to 3 hours. So , we are designing plants with different specifications . But basically, the gigawatt hours is fixed is 10 gigawatt hours, but we may put the AC capacity depending on whether we want the dispatch to happen within 2 hours or 3 hours.

And that is a call we will progressively make depending on how we see the market evolving as we move forward. From a capital cost perspective, you can consider a cost of about INR1.5 crores per megawatt hour. So that should be about INR 15,000 crores total capex in the coming years for the battery storage that we want to set up.
Moderator: The next question is from the line of Nikhil Nigania from Bernstein.
Nikhil Nigania: Good to see the numbers. My first question is on the future growth plans. You, of course, have 2 big PPAs tendering recently including the one in Maharashtra. But beyond that, we don't see Adani Green actively participate in some of the recent renewable tenders. So is the plan beyond that to focus more on the C&I/data center space via Adani Energy Solutions, as you mentioned earlier? Or are there so me other plans to build the pipeline beyond that?
Sagar Adani : Yes, Nikhil, absolutely. From our perspective, today, in addition to whatever the capacity is there obviously, we have a total of 28 gigawatts that's already signed up. So, we probably have one of the highest PPA signed up capacity for any company in the country today. As I said, directionally, it's very clear that there's obviously a lot of developments happening in the market. The nature of contracts that DISCOMs are coming up with is changing very significantly.
The type of power that C&I customers are looking for going forward is changing very dramatically. There's obviously a lot of demand expected at our sister company, Adani Energy Solutions which is working on demand from upcoming data centers, a lot of

other industrial consumers that it is also in parallel tying up for with Adani Green which will take up a lot of this open capacity and open power of Adani Green go ing forward. So, there's a lot of these things that are expected. But as I said, directionally, we will make sure that more than 90% of installed capacity of AGEL is tied up in long -term contracts and nothing changes from that perspective.
Nikhil Nigania: Perfect. That's helpful. If you could a

lso clarify, sir, today, Adani Energy mentioned, I think, about 5 gigawatts is what they have signed up on the renewable front, which I'm supposing is with Adani Green. Possible to give some color on what are the com mercial terms for that arrangement?
Sagar Adani : So Adani Green Energy Solutions, both contract capacities on an arm's length market test basis. So, both companies and both management, so Adani Energy Solutions has an independent market test view in terms of , if they wanted to buy within that time frame, the given quantity of solar power, what are the rates that they would be able to contract at.
And similarly, if Adani Green wanted to sell that quantum of power in that time frame, what is the rate that it would be able to sell at. So it's an independent market discovery on both ends and the management independently sit together and agree on a rate that is workable on both ends from a market -linked basis.
So I think that's the basis on which they decide. I think that number today, as I said, it's somewhere between INR 2.60 to 2 .80 for solar and somewhere between INR 3.70 to 3.80 for wind. And those are numbers at which they're contracting today.
But obviously, the number may move, may change depending on how market situations evolve because both companies always look at opportunities that they have from the market independently. And we'll always look to find that middle ground threshold in terms o f the number that makes sense for both.
Nikhil Nigania: Got it, sir. And if I may add to that, on the battery front and the pumped storage coming online this year, is the plan to keep that merchant for now and then later possibly use it as part of these contracts on other similar contracts?
Sagar Adani : Yes. So basically, we internally have a lot of capacities that are tagged for a lot of the opportunities we think are going to convert in the next couple of months. So we have a very clear visibility and line of sight on all of the assets, be that the pum ped hydro assets, the battery storage assets or the solar and wind, which either go into pump storage or battery storage or are being delivered independently.
So we have line of sight very clearly on all of those being contracted and we're reserving those capacities accordingly so that the respective C&I customers that will finally be contracted with have capacities available in the time frame that they want th em.

Nikhil Nigania: Makes sense. And if you could give some color on last quarter to this quarter, we see a good improvement in performance. Was it due to the Rajasthan line getting commissioned? Was it due to because merchant prices were low again last quarter. So what drov e the better performance and possibly lower curtailment?
Sagar Adani : So a very good question again. It's been a multitude of factors together. It's been the Rajasthan line being commissioned, yes. It's been additional lines being commissioned at Khavda, where the evacuation bottleneck that we had in Khavda has opened up ve ry significantly. It's also been relatively better merchant pricing compared to what there was in Q3. So just all of these factors put together have contributed to that.
Sagar Adani : Sorry, we've also Mr. Ashish Khanna, CEO of Adani Green is also sitting next to me. He's also pointed out the fact that we've also added 2 gigawatts of additional capacity in the last quarter. So the short time for which those capacities have run as well, they've also contribut ed to EBITDA similarly.
Nikhil Nigania: Makes sense. And would you say the worst is behind, given you guys are involved across the value chain on transmission, on generation for transmission curtailments and the transmission issues, would it be fair to say that?
Sagar Adani : Well, we work within the regulatory framework of India, which can many times be relatively complicated and

is not always that straightforward, right? So we're talking about very significant capacities being added in the country over the next 5, 7 years across multiple places in the country, all being interconnected with each other at the same time, interfacing with what the demand profile looks like as well.
So, if your question to me is that does this ensure that there will never be curtailment going forward, that everything will be hunky dory and run smoothly. I think we should always make sure and work from the perspective of expecting that in a country that's as complex and as interfaced as India is, there may always be pockets of uncertainty or complications that come up from time to time.
So just being very honest and frank with you, I don't think that one or anyone can say that this issue is permanently behind us. All we can do is what is in our hand, which is what we are doing, which is making sure that we have enough and more battery capacities being added up that even from a country perspective, if this matter becomes an issue, it does not remain an issue for Adani Green.
So that is what we are focused on, that how do we make sure that all the elements linked to Khavda are coming on time, how do we support that? How do we accelerate that? How do we make sure that, that is tracked very, very closely? And how do we make sure that our storage capacities come online very, very rapidly and in size so that whatever constraints are there may be at the sector level don't apply to Adani Green because of the way in which we're executing capacities.
So, we obviously understand and know what the risks are. We know what the issues might be. And that's why we have a very close eye in terms of exactly how evacuation

is coming up in various places. And at the same time, have a very strong push on setting up our own storage capacity so that we get insulated from any of these country -level macro issues to the extent that is possible.
Nikhil Nigania: Makes sense. And one last question from my side. I think CEA released a plan on generation capacity in India in the next 10 years. And as per them, solar addition is tough to take beyond 35 gigawatts a year even in a 6.4% demand growth scenario. Would you agree to that? Or do you think that's a conservative number?
Sagar Adani : Well, this year, we have executed 55 gigawatts, right, as a country. So, see, again, I think it's not the right way to look at a 5 -6 year total capacity addition divided by 5 years and say that that is what the capacity addition will be year -on-year. In my relatively limited experience of working in this sector, we see that growth in India comes in spurts and bursts.
Because these are all infrastructure projects that have long lead time, right? It's not something that moves very smoothly every single year. Sometimes you may achieve 20 GW, sometimes you may achieve 50 GW and then they may go back to 30 GW and may go up to 60 GW the next year.
So a little bit of that move will continue to happen on a year -by-year basis. But directionally speaking, going forward, obviously, the Government of India and many state governments have taken very significant positive decisive steps to make sure that the overall planning and the overall capacity addition and how to integrate the

evacuation with the capacity addition and the demand at the back end happens in as smooth and as sync up a manner as is practically possible.

So, and regulations like those and efforts like those have led us to a situation today where last year, 55 gigawatts of clean energy were added into the grid. That's a very, very substantial number. If you look at India 5 to 7 years ago, people were talking about a number that would peak out at 15 or 20 GW versus that, we've added a number of 55 in the past year.

So obviously, that's all credit to the really good job that th

e government has done in terms of streamlining things. And at the same time, the private sector has also stepped up in a very significant way across all companies to be able to put these capaci ty additions on the ground.

And all the stakeholders, right, the EPC participants, the banks who all rally together to make additions like these happen. But we see that overall, the sector is in a very comfortable and positive space, and we think that's going to keep on continuing g oing forward.

Moderator: The next question is from the line of Pritesh Chheda from Lucky Investment.

Pritesh Chheda: Sir o ne of your previous answers about your financial execution ability of executing 7000 to 8,000 megawatts and we are 4 ,000 to 5000 megawatts . When we look at the

annual 5 -year vision of about 50,000 megawatts total , we need to do 7000 megawatts compared to an addition of 4 ,000 to 5,000 megawatts in the last 2 year, th ese numbers should move to 7,000 to 8000 megawatts from FY28 onwards as you want to prepone your battery expansi on ahead of the solar expansion?

Sagar Adani : So again, good question. We will be looking at an addition in the coming year of somewhere between 4.5 to 5 GW. And the limit on that addition is primarily due to our view in terms of how evacuation constraints might come up. We don't want to guide to a number of FY28 , FY29 today because it's a very closely evolving target.

It's pretty much impossible to have a view of transmission 24 months out because of so many different linkages and nuances that have to do with many of those transmission lines coming because keep in mind, it's not unlike renewables, which is execution wi thin a certain boundary, transmission line is cross country and local issues come up and stringing issues come up and ROW issues come up.

And those issues have a way of cropping up, right, in a way that you don't expect. So what we have decided for ourselves at AGEL is we will make sure that we commit to a capacity on a 12 -month forward basis, not only from a market guidance perspective, but also from an internal planning perspective because we want to make sure that we don't either overplan or underplan this is what evacuation flexibility is going to open up and come up.

So that's how we typically look at it and think about it. But obviously, as you rightly pointed out, the hedge against all of this for us is battery storage. So 1. 3 gigawatts that we added in the last 3 to 4 months, soon to be 3 gigawatt hours actually is 50% of India ’s total capacity .

Once our capacity touches 3 gigawatt hours, we will have 50% of operating battery storage capacity in the country. That's very, very substantial and significant. Now we're ramping up that to 10 GWh . 10 gigawatt hours is a very significant capacity addition to be done by a single company in a single year.

Now our endeavor will be to increase that even further from a run rate perspective in FY28 . But obviously, we will see what experience we have, what learnings we have this year and then calibrate our plan for FY28 accordingly.

Pritesh Chheda: Okay. Does this need a review to the 50 GW capacity in FY30?

Sagar Adani : Currently , we are gearing up to find a way to deliver on the target that we've announced.

Moderator: The next question is from the line of Bhavik Shah from Invexa Capital.

Bhavik Shah: Congratulations on a good set of numbers. Sir, what I understand is by 5 gigawatts of RE execution and 10 gigawatts of battery coming up, so our capex for the year would be at around, say, INR 45,000 crores if that understanding is correct? Because

obviously, we'll be executing some and you will start some for the next year as well. So

is that understanding correct?
Sagar Adani : Around INR 40,000 to 42 ,000 crore is what we ar

e guiding to the market generally. But
yes, the number can touch around the number that you're speaking about.
Bhavik Shah: Understood. And sir, with the recent improvement in the rating, our blended rate is at 8.9% in the presentation. Do we see improvement there? Or will it remain same?
Sagar Adani : We expect downward pressure on that number.
Bhavik Shah: Understood. And sir, when we say we are only about to add say 4.5 to 5 gigawatts in this year, so can you just quantify the evacuation facilities coming up, say, at Khavda or Rajasthan in, say, FY27 and FY28 , just to be able to understand how this trajectory would be?
Sagar Adani : So, we expect an additional 7 gigawatts of evacuation that is opening up in Khavda by December of 2026. There are a few other people who will also be participating in those capacities. And then we expect an additional 7 gigawatts that is coming up by March of '27.
Sagar Adani : So, from where we are today, somewhere between 14 to 15 gigawatts of additional capacity should open up in Khavda over the next 12 to 15 months. And obviously, that number can move above or below by 3 to 4 months. There's always that margin of error you have to con sider when you're considering evacuation because things can move by that much. But yes, that's broadly what we are expecting.
Bhavik Shah: Understood. So would it be fair to assume that in FY28 , you might see a sharp jump in our execution as well?
Sagar Adani : If the evacuation capacities open up as per our expectations, then obviously, we will look to ramp up our execution on the ground for solar and wind capacities as well. But exact numbers, we will be guiding for FY28 somewhere towards the end of this year.
Moderator: The next question is from the line of Sabri Hazarika from Emkay Global Financial Services.
Sabri Hazarika: Congratulations on steady numbers. So I just wanted to clarify. So right now, we are like close to 20 gigawatt of capacity. So this 50 gigawatt could be like 5 gigawatt for the next 5 years and another 5 to 6 gigawatts of PSP. Is that right way to assume?
Sagar Adani : That is the right way to think about it, yes.
Sabri Hazarika: Yes. And batteries would be like on top of that. But battery and PSP, in a way, they are like not pure capacities. Those would be like basically ESS supporting capacities, right?
Sagar Adani : Correct. You're right.

Sabri Hazarika: Okay. Given the current geopolitical scenario, have you seen any sort of like change in the policy environment with respect to renewable energy? I know it's like quite robust all along, but have you seen some more importance coming up on the policy side with respect to renewable energy sector in general?
Sagar Adani : 100%. I think not only the renewable energy sector, but every single sector that touches electricity has a very significant thematic advantage because from an India perspective, the answer to so much volatility happening globally is electrification, which is similar to what China has done, right?
So instead of importing crude and importing gas, if we're able to electrify our economy domestically, that takes away from a very significant amount of dependence on regular crude and gas flowing from many of the areas that are and may continue to be affe cted by the conflict that is going on today.
So not only Adani Green and not only the renewable energy sector, but any and every sector that touches electrification is poised to have a very significant advantage from this because what we've seen and rightly so from the government that the priority f rom a country perspective going forward is going to be a very significant amount of electrification that we expect to happen across the economy comprehensively.
Sabri Hazarika: Right. And just one last question. With respect to the evacuation capacity, you mentioned 14 gigawatts w

ould open up in the next 12 to 15 months . So right now, what is the number for Khavda in general? And also wanted to get some color on the evacuation on the grid situation on the customer side. I think you've got like I mean not directly, but indirectly Andhra Pradesh is one of your major customers. So what's the situation like there?
Sagar Adani : The situation from what perspective, I'm sorry?
Sabri Hazarika: Evacuation perspective. Transmission, yes.

Sagar Adani : Okay. So from a Khavda perspective, we have 9 gigawatts of transmission capacity that is currently active. From a customer perspective, I mean, evacuation is something that's open for both, right? So from an Andhra perspective or from a buyer perspective, obviously, the PPAs come into effect only once the evacuation capacities are ready. So they don't really have much of a role in this matter.
As soon as the evacuation capacities become ready by the transmission network, the PPAs become live and active. And what we are doing is that all the capacity addition that we need to do on the back end before the evacuation capacities get online is what we are focusing on. So when the day that the evacuation capacities are online and the PPAs become active, our capacities are ready.
Sabri Hazarika: But you mentioned that INR 1,500 crores of under recovery would get alleviated over the next 1 to 2 years, right?

Sagar Adani : Because of better rates that we are seeing with a visibility of contracting and lower curtailment .
Sabri Hazarika: Got it. Thank you so much.
Sagar Adani : That was onetime loss, yes.
Moderator: The next question is from the line of Nikhil Abhyankar from UTI.
Nikhil Abhyankar: Just one question from my side. Recently, we have seen that Adani Power has participated in an RTC renewable bid. So just want to understand whether this is a onetime thing? Or would you see them participating in other bids going ahead as well ?
Sagar Adani : So I can't answer a question about Adani Power in the Adani Green earnings call. So my apologies, but you will have an opportunity to ask the Adani Power management the same call when they have their earnings, which I believe is sometime next week.
Nikhil Abhyankar: I wanted to understand more from a group's perspective; the general perception was that green will be executing the RE generation system. So from that perspective ?
Sagar Adani : Basically, I'll tell you for many of these contracts, there are 2 elements to it. And let me just give you a macro answer and then you can use it as per how you feel is best. There are always 2 elements whenever we're looking at RTC capacities. One element is where the capacities are coming from. So many of these RTC bids and tenders make sure that they need a certain amount of thermal power . They need a certain amount of renewable power, they need a certain amount of stored power, they need a certain amount of wind. They need multiple sources that come in from multiple places to be able to bundle a power that can be provided on a predictable basis through out the day. So how do you get that power from what sources at what rates, from which companies becomes one side of the thing.
Similarly, on the other side, it becomes very important, how do we manage the customer. So which is going to be the entity that is facing the customer and providing this overall solution to the customer and why? From a group perspective, the call that we've taken collectively and individually because that is how the strengths of every group c ompany is that respective generating companies will be responsible for and will be participating in the opportunity to provide a lot of these capacities .
And making them available for contracts and for such opportunities, which may be profitable in nature from a customer standpoint. And then Adani Energy Solutions is the entity th

at will take end -to-end responsibility of blending all these sources of power a nd giving one comprehensive "energy solution" to the end consumer and to the end DISCOM. So that is a principle that you will always see group companies follow as we move forward.
Moderator: The next question is from the line of Anuj Upadhyay from Investec.

Anuj Upadhyay: I just want to get some clarity on what strategy we are taking on this 10 gigawatt hour in the long -term basis? Would it be exclusively parked towards the 25% of the targeted merchant capacity, which we will have by FY30 so that this curtailment issue can get addressed? Or probably we are flexible enough to use this 10 gigawatt hour capacity either as a stand -alone storage capacity, which might be used in the second bit, or it could be used for the upcoming FD RE projects as well? So just to get your thought on this?

Sagar Adani : So, they'll be available for all 3 purposes, Anuj, and we'll make sure that they are flexible because we see, again, we don't want to be in a situation where we have a fixed target in an evolving market. So because the market at the end of the day is an evolving one, our planning, our working will always also be evolving. So today, basically, what we are focused on is fundamentally having the option and the ability of setting up these storage capacities in a significant way is what we are focus ed on because that is fixed in every scenario.

Whatever option you want to go for, you need to have those capacities in the first place. So our focus today is that we want to lock in those capacities. We want to commission them. We want to get them ready. We want to install them and we want to make su re that they are available to then participate in whichever economic opportunity seems the best for them independently.

So our focus today is to make sure that we set up these capacities. And as the market evolves, which is the specific area where the economic opportunity is the highest, that is where we will deploy them.

Anuj Upadhyay: Fair point. Quite clear on this thing. And also, we are witnessing a lot of curtailment , especially in case of Rajasthan, while we have a long -term project PPAs but any thoughts on having stand -alone BESS in Rajasthan as well?

Sagar Adani : Yes, we will be having BESS in Rajasthan going forward. But just to clarify, our projects are not getting curtailed in Rajasthan. Our projects are being evacuated. But that being said, yes, we will also be having BESS projects in Rajasthan as well, yes.

Moderator: The next question is from the line of Puneet from HSBC.

Puneet : My question is basically with respect to your slide where you talk about growth in generation and you've broken this down between PPA -based merchant and PPA, which is currently sold on merchant, right? And if I look at that slide, which is Slide No 16, it seems only 5% growth has happened on the PPA -based capacity, while in your overall capacity, 35% capacity got added.

So, to what extent is the PPA -based capacity, which you currently categorize as merchant is still likely to remain on merchant for some more period of time? And if you can quantify that capacity as well ?

Sagar Adani : So, as I touched upon in one of my previous comments, last year was an anomal y because ISTS benefits for merchant projects and all future projects were going to go away from this year onwards. So , we wanted to deliberately make sure that we do a disproportionate amount of merchant capacity addition last year because those projects get ISTS benefit for the next 25 years.

So that remains and becomes a structural advantage for us over the next 25 years for that number of capacities compared to all of the other new capacities coming up. So it was a very deliberate decision on our si

de. But that is an anomaly. Going forward, you will see all or most capacity being added from a PPA perspective. Even in FY27 , the 4.5 to 5 gigawatts that we're adding in terms of capacity is 100% PPA.

Puneet : And the way you've broken down generation, can you also break down your capacity?

Sagar Adani : So see, from our perspective of PPA. So, we have 19.3 gigawatts of operating capacity. Out of that, 9.7 gigawatts of operating capacity is going 100% under PPAs. 5 .3 gigawatts of capacity are going as infirm today, but those are PPA capacities that are going to be converted into PPAs as soon as all the elements are in place. So that's an interim merchant, which is going to automatically get converted into PPA. That's 5.3 gigawatts. And 4.2 gigawatts are pure merchant capacity, which we will tie up in long - term contracts, ASAP.

Puneet : Understood. So the 5.3 gigawatts, which is in the infirm when do you expect the PPA to start for this capacity? Would be this year or do you expect maybe?

Sagar Adani : All of this will incrementally happen by December of 2026. Some of it might remain, which will get done by March 2027 . But that will continue as infirm selling in the merchant until that point in time. But again, it's a question of elements, right? So as soon as all the elements come up, they'll automatically get converted into PPAs.

But bear in mind, please, from a profitability perspective, all of the revenue and EBITDA we are making under these projects as infirm revenue today is over and above the PPA economics. So for us, this is an additional delta that we get from an overall pe rspective.

And so essentially, it's not a value destructive thing for us.

Puneet : And this is despite you witnessing curtailment in the same project, right? Because PPA would not have curtailment, I would assume?

Sagar Adani : Yes, PPAs don't have curtailment. That's a take -or-pay.
Puneet : Yes. So, for this 5.3 GW plus 4.2 GW, which is about 9.5 GW again, there is some bit of curtailment. So, the entire hit of INR 1,500 crores, which you said has happened to the extent of only this half of this capacity?
Sagar Adani : Absolutely. Yes, you're right.

Puneet : Okay. Understood. And secondly, in FY2 5, you installed about 2.7 gigawatt of solar and close to 600 megawatts of wind. Can you also talk about your experience there? What is the PLF you experienced for this 2.7 gigawatt and 600 megawatts of wind? Because the overall PLF number sort of dilutes the impact of PLF from the new plants. So just specifically for FY25 capacity, what is the PLF you experienced?
Saurabh Shah : For this year, most of the capacities or all of these capacities have come in Khavda only. And in Khavda, we have a very good CUF as compared to the overall CUF, which we have in our portfolio. So, for Khavda, even without this curtailment, we have had a CUF upwards of 27%. And in wind also, we have CUF upward of about 29 -30% in Khavda.
So, from that aspect, Khavda continues to increase the overall CUF for the year . However, because of curtailment about 2.5 % to 3% of CUF impact ha s been there, which will progressive ly come down. And as Khavda 's capacities keep on increasing, the CUF should see an uptick going forward.
Puneet : So, 27% in Khavda from solar should have been 30% and wind also similarly 2%, 3% more or wind was largely, okay?
Management : Wind was largely okay, but there was some reduction in Q3. Generally, Q3, it starts to go up from Q4 onwards.
Sagar Adani : The curtailment is primarily attributable to solar, much less so for wind. Because wind generates in the evening were, solar capacities have gone down. So a lot of transmission capacity is available.
Puneet : Right. Understood. And in your 9.4 gigawatt capacity, which you talked about for Khavda, about 742 MW you say is for group companies. So is that built

by you? And
does the EBITDA accrue to you ?
Sagar Adani : Yes, it is built by us. No, that EBITDA is not a part of Adani Green.
Puneet : Okay. So that's for other group companies in a way.
Sagar Adani : They're setting up on their balance sheet and the EBITDA or the cost in terms of the electricity cost accrues to them.
Puneet : Understood.
Sagar Adani : Adani Green gets a project management charge for the capacities that they execute.
Moderator: I'll hand over to you for closing comments. Thank you, sir.
Sagar Adani : Thank you, everyone, for taking out the time . And we appreciate your participation.

Dear Sir,

Sub: Transcript of Earnings Call pertaining to the Unaudited Financial Results
for the quarter ended June 30, 2026

With reference to above, we hereby inform below link of transcript of the Earnings Call with Equity Investors on Unaudited Financial Results (Standalone and Consolidated) of the Company for the quarter ended June 30, 2026 held on July 22, 2026.

Web link to access above transcript is: https://www.adanigreenenergy.com/-/media/project/greenenergy/investor-downloads/results-conference-call-transcript/agel_q1fy27_transcript_v1.pdf

Kindly take the above on your records.

Thanking You

Yours Faithfully,
For, Adani Green Energy Limited

Pragnesh Darji
Company Secretary

“Adani Green Energy Limited
Q1 FY27 Earnings – Equity Conference Call”
July 22 , 2026

Management:

Mr. Ashish Khanna – Chief Executive Officer – Adani Green Energy Limited
Mr. Rajat Seksaria – Chief Executive Officer – Battery Storage
Mr. Saurabh Shah – Chief Financial Officer – Adani Green Energy Limited
Mr. Vijil Jain – Head, Investor Relations – Adani Green Energy Limited

Moderator:

Mr. Baiju Joshi – Macquarie Capital

These uncertainties may cause our actual future results to be materially different that those expressed in our forward - looking statements. We do not undertake to update our forward -looking statements.

Baiju Joshi. Hi. Good evening, everyone. Welcome to Q1 FY '27 Earnings Call of Adani Green Energy Limited, hosted by Macquarie. From the management team, we have Mr. Ashish Khanna, CEO of Adani Green; Mr. Rajat Seksaria, CEO of Battery Storage; Mr. Saurabh Shah, CFO; and Mr. Vijil Jain, Head of Investor Relations. Without any further delay, I will hand over the mic to Mr. Vijil Jain to start the proceedings. Over to you, sir.

Vijil Jain. Thanks, Baiju. Thank you, everyone, for joining in the call. Good day, and warm welcome to the call. I hope you got a chance to go through the earnings material, which was uploaded on the website, and which was uploaded on the stock exchanges.
Just to explain the flow of the call, we will start with an opening statement from the CEO, Mr. Ashish Khanna, followed by Q&A, and then closing remarks from the CFO, Mr. Saurabh Shah. Without further ado, I'll just hand over the call now to Mr. Ashish Khanna for the opening remarks. Over to you, sir.

Ashish Khanna. Thank you, Vijil. Good afternoon, everyone. Thanks for joining this call. The country reached 283 GW of installed non -fossil capacity, achieving over 50% of India's cumulative capacity ahead of its 2030 target. This demonstrates the strength of the green energy ecosystem and policy support. India remains firmly on track to achieve 500 GW of non -fossil capacity target by 2030. It is among the fastest -growing renewable energy markets globally. At Adani Green Energy, FY '27 commenced with strong momentum. We surpassed 20 GW milestone, making it India's largest and fastest greenfield renewable capacity addition. This will power over 9 million homes and avoid about 37 million tons of CO_2 emissions annually.
The accelerated capacity growth was enabled through disciplined execution and strength in demand environment. Our focus on technology adoption, digitization, and data analytics for predictive maintenance has also been a key enabler for superior operational performance and maximizing asset availability. Adani Green Energy is firmly poised to reliably meet growing clean energy needs while delivering industry -leading

operational performance. As renewable energy penetration and power demand continue to rise, energy storage is essential for reliable round -the-clock power and grid stability. With our renewable portfolio and investments in battery as well as pump hydro storage, we are well positioned to benefit from key sectoral trends for firm and dispatchable renewable energy, rising AI - and data -center -led power demand and integrated RE plus storage solutions to meet peak power demand.
Our energy sales rose 30% Y -o-Y to 13.7 billi

on units. This was driven by 4.3 GWs of energy capacity addition,
a 27% increase, and strong operations. We remain on track to add 5 GW of greenfield capacity this year. We commissioned 1.9 GW of battery energy storage capacity at Khavda during the quarter, taking total installed capacity to 3.5 GW -hour. With this momentum, we are well positioned to achieve our 10-plus GW-hour target this year. We are also on schedule to commission our maiden 500 MW pump storage project at Chitravathi, Andhra Pradesh, in this financial year. Adani Green Energy continued to deliver robust financial performance in FY '27 first quarter. The company's revenue from power supply increased from INR4,280 crore, a 29% increase on Y -o-Y basis. And EBITDA from power supply surged by impressive 33% to INR4,122 crore, thereby achieving 94% EBITDA margin.

Our CapEx of INR8,800 crores during the quarter increased by 41% Y -o-Y, highlighting the efficient capital deployment with every passing quarter. Our landmark project at Khavda, the world's largest renewable energy installation, continues to build progress. We have already included group capacities over 10 GW of solar, wind, and hybrid assets. On a sustainability front, AGEL achieved the highest CRISIL ESG score in

the Indian power sector for the fifth consecutive year. As a mark of global recognition, Adani Green recently received Clean Power Generation Award at Reuters Energy Industry Awards 2026 in New York.
Thank you, and we look forward to answering questions.

(Question And Answer)
Baiju Joshi. Thank you, sir. We will now start with the Q&A session. A request to all the participants to use the Raise Hand feature at the bottom of their screen to ask any questions. We'll wait for a moment till the question queue assembles. A request to all participants to use the raise hand feature to ask any questions. We'll take the first question from Nikhil Nigania. Nikhil, please unmute your line and go ahead.
Q - Nikhil Nigania. Am I
audible? A - Baiju Joshi Yes.
Q - Nikhil Nigania. Hi; so my first question is on curtailment, if you could share more color on how that is panning out and quantify the impact of curtailment in this quarter.
A - Ashish Khanna. Nikhil, thanks for your question. I think it has been in line with our expectations, and we do expect that by the end of this calendar year, especially from Khavda, we would not be having an issue of a curtailment as was the case initially in quarter of the last year.
However, in the current scenario, as was the trend in the past, a curtailment has an impact of in the range of 5% to 7% on our overall EBITDA as we speak. Gradually, as and when more transmission lines are going to come up, we do foresee these tendencies of curtailment to weed out. And, by the end of this calendar year, our expectation is that there should not be any curtailment, at least from Khavda, for all the capacities which we have installed.
Q - Nikhil Nigania. Got it. Understood. Thanks for that. My second question is, if I look at the list of operational projects at the end of the presentation, most projects which were classified or at least mentioned as merchant renewable plants are now being mentioned as C&I renewable plants.
So, wanted to understand the rationale for it, and, related to that, today morning Adani Energy had a call where they mentioned that about 4 GWs of generation is contracted by them from Adani Green. So, if you could share light on that as well.
A - Ashish Khanna Yes, I think it is exactly in line with what Adani Energy said. In order to de -risk ourself and concentrate more on the project execution and operational excellence, on a long -term basis, we have contracted on an arm's length basis and with new approval of the Board on arm's length transaction, as well as we hav

e ensured that we have a contracted capacity rather than taking the risk with Adani Energy Limited.
And that is what is the capacity which they have shown and is a part of what is also reflected here on the C&I business.
Q - Nikhil Nigania Got it. So, is it fair to assume that what we were planning as merchant earlier is now effectively being sold as C&I to Adani Energy to de -risk ourselves on a long -term basis, as you said?
A - Ashish Khanna. Exactly. So, what we have, we have taken off the risk of merchant capacities and the risk thereof, ups and downs. And, considering the recent tariffs, which were there on the long-term PPAs, this is the same return profile we have signed off with the Adani Energy.
Q - Nikhil Nigania. And would this apply to the battery storage plant that we have operationalized as well? All of it is in effect contracted to them?
A - Ashish Khanna. Yes. So, all that, which was supposedly merchant for us to de-risk it, we have tied up and going to tie up with AESL. The strategy remains the same on having a long -term returns and de -risking AGEL

from it.
Q - Nikhil Nigania. Got it. So, then effectively the 2030 pipeline that we have or the target that we have set for ourselves, whatever was classified as merchant/C&I would be through AESL and whatever is directly to DISCOM, only that will be sold by Adani Green.
A - Ashish Khanna. Yes. Other than those projects where we are ahead of the time, like we always keep on sharing with you. And on certain projects where the PPA is there, and we are ahead of the time and the PPA has not yet commenced, we sell it again to the market on our own. So, that risk remains, which

actually is the addition from whatever returns we get from those projects on a long-term basis once the PPA get operationalized.
Q - Nikhil Nigania. Understood. And any reason why we have made this structure, this is the last question I had, to not to sell directly. So, why is Adani Green directly not selling to a C&I customer? And why is Adani Energy in the middle? What is the rationale or strategy behind that?
A - Ashish Khanna. I'd share with you that, we concentrate more on operational excellence, project execution, deploying the CapEx more efficiently, and then de -risk any vagaries of market from long -term perspective, and get our long-term returns as per our expectations with which we are building the project. Ups and downs of the market, we are not taking into consideration, and hence to de -risk ourselves from those we have tied up with Adani Energy.
Q - Nikhil Nigania
Understood. Very clear. Thank you. Those were my questions. Thanks for answering.
A - Baiju Joshi
Thank you. We'll take the next question from Apoorva Bahadur. Apoorva, please go ahead with your question.
Q - Apoorva Bahadur
Hi; thank you. I hope I'm audible. Sir, just double -clicking on this arrangement with Adani Energy. So, I think currently we have 3.5 GW -hours of battery deployed. Target is, I believe, around 10 GW -hours. So, the capacity is coming in the course of this year. All of that will also be tied up with Adani Energy?
A - Saurabh Shah
Yes, it's all in line with our long-term strategy.
Q - Apoorva Bahadur
Okay, and the pump storage as well? I think we have a target of 5 GWs by 2030.
A - Saurabh Shah
Within, see, within pump storage, there are certain projects which are already a direct tie -up that we have done. So, in those cases, there might -- there will not be any tie-up which will be going through AESL. But, in cases where it will be a merchant, we will continue to evaluate and do the contracts as we move forward in PDA in case of pump hydro. See pump hydro anyway except for the Chitravathi project is still about two years away. So, that we will take th

e call as we move forward. Yes.
Q - Apoorva Bahadur
Okay. So, Chitravathi is it tied up with AESL? Or does it have a direct contract?
A - Saurabh Shah
Not yet. It is not tied up. It does not have a direct contract right now. We will evaluate it at the near to the stage when it is about to get executed and then take the call.
Q - Apoorva Bahadur
Okay. Secondly, for your agreements with AESL on both say solar, wind, and the battery capacity, you flagged that the tie -up happened at a price which was approved by the Board. I want to understand: is this agreement for long term as in 20, 25 years, and is there a clause for price reset during this term of the agreement, or is it fixed for the entire 25 years?
A - Saurabh Shah
So, in case of batteries, it is for 15 years and fixed for that period. And, in case of solar and wind, it is for 25 years and fixed for the price at a rate. So, there is no change which is expected.
Q - Apoorva Bahadur
Okay. And can you share at what price per kilowatt -hour, say, did you tie it up for solar, wind, and battery separately?

A - Saurabh Shah
See, as we mentioned, it is at a benchmark, which is going on in the market right now. So, there is no -
- we cannot do. We both are listed entities, and there is an arm's length involved, Audit Committee involved. So, it is at a benchmark rate.
Q - Apoorva Bahadur
So, benchmark for solar and wind, yes, would be around, say, INR2.7, INR3.4, INR3.5. And how much would it be for batteries?
A - Saurabh Shah

Yes. So, batteries again, we keep on evaluating the long-term averages that IEX has and then based on that plus because see battery today, there is no such long -term contract also available in the market. So, as the price stability comes in, there is an overall return profile that we look at and our CapEx -to-return profile, all those things have been considered while that of the battery capacity.
Q - Apoorva Bahadur
This return profile would be in line with your hurdle IRR of what 15%, 16%? Is that a fair assumption?
A - Saurabh Shah
Yes.
Q – Apoorva Bahadur
Understood. Thanks a lot.
A - Saurabh Shah
Thank you.
A - Baiju Joshi
Thank you. Just a reminder to the participants, you can use the Raise Hand feature to ask questions or you can also type in your questions in the Q&A box.
Sir, I had one question from my end on BESS site. Just wanted to understand how the EBITDA trajectory evolves for FY '27, and what are your overall plans for this segment beyond FY '27 as well?
A - Saurabh Shah
So, see, from the BESS perspective, we have given a thumb rule, which is going to apply for the overall EBITDA profile for FY '27. It's about INR25 lakh to INR30 lakh per MW -hour in that range where the EBITDA would come in based on the capitalization that takes place over the next nine months of the year.
The first contract has come in, which is 3.5 GW -hour, which was fully capitalized by May end. So, the full benefit of that EBITDA will now come in over the next nine months, plus as we capitalize more and more asset. We have given a target of at least 10 GWs upwards of cumulative BESS capacity, GW -hour cumulative base capacity, while the overall target till FY '30, we have come out and said that we would like to do about 50 GW -hour of batteries till FY '30 and that's where we, the ambition is.
A - Vijil Jain
Just to add to that, so basically, as we move ahead, we will also start reporting BESS numbers separately going forward, so from that perspective, the contribution will become visible .
A - Baiju Joshi
Thank you, sir. We have one question in the Q&A box: what is our run-rate EBITDA for the operational portfolio plus already tied up BESS C&I portfolio?
A - Saurabh Shah
So, our current run-rate EBITDA for the operational portfolio is about INR17,000 crore. For the expected for the FY '27, it is about INR21,000 crore.

A - Baiju Joshi
And for the already tied-up BESS C&I portfolio?

A - Saurabh Shah
So, the overall number is given here, which includes the BESS. See, BESS for the first year may not be a very large number in that sense.
So, as we move forward, we will be able to give a more sense on two separate EBITDAs, but, right now, from a run-rate EBITDA perspective, when I say INR17,000 crores today and INR21,000 crores by FY '27 end, is something where it includes the number.
A - Baiju Joshi
Right. There is a follow -up question on that sir, regarding the arrangement with AESL, the question is for how many years have we tied up with Adani Energy?
A - Saurabh Shah
So, it is for each project, on a long-term basis it is 25 years, is what we have tied.
A - Baiju Joshi
Thank you, sir. Reminder to participants, use the Raise Hand feature to ask any questions. We'll take the next question from Swetha Rakhecha. Swetha, please go ahead with your question.
Q - Swetha Rakhecha
Hi. Congratulations on hitting the 20 GW milestone. And also, at Cantor, we're looking forward to seeing the separate line item for best going forward.
I had a quick question on the PPAs. It was mentioned in the slide that 31% of the annual PPA requirement has been covered this quarter. So, how much of that is seasonal versus structural, and what needs to happen in the balance of the year to ensure full -year delivery?
A - Saurabh Shah
So, see, this is more structural in nature. A lot of these PPAs, there is not always -- from a PPA perspective,

the CUF is more important that we are achieving that CUF, and that is better in Q1, and it is as per the plan only. And, from that perspective, that is 31%, which is achieved today. We generally are about 100% on an every -year basis. So, that will continue to be there. Our last two, three years' average has been about 109%, 110%. So, that same --

A - Ashish Khanna

And I'll fine with just like to add, I think quarter, you would have realized that the weather God has been decent, whether it is sun or wind. And hence we do foresee a decent performance from the weather, which is forecasted as of now, on the overall MUs generation, which is reflected very well in our EBITDA conversion.

Q - Swetha Rakhecha

Right. So, just to look at the cadence, like an ask of a follow -up. Can we expect similar cadence as last year for the rest of the year?

A - Saurabh Shah

Yes. Of course, Swetha, definitely.

Q - Swetha Rakhecha

Okay. Also, just one more follow -up on the PPAs, which is something that we get some inbound on, is given that several PPAs only become live when the central grid sort of substation and transmission lines are ready, what is sort of the timeline for the next 14 GWs of evacuation capacity additions? And what is sort of the risk of holding these assets?

A - Saurabh Shah

Sorry, can you repeat? The voice goes up and down in the process.

Q - Swetha Rakhecha

Okay, I apologize for that. This is just a follow -up on the PPA aspect. I know we're sort of expecting 14 GWs of evacuation capacity addition. So, I just wanted to ask, like, what is the timeline when we look at the substation and the transmission lines? I hope I was audible this time.

A - Saurabh Shah

Yes, sure. Thanks. I think we do expect, by the end of this year, another 7 GW, which is going to come. That is this calendar year. And another quarter or two, the balances should be there online.

Considering our experience of the past, from our company standpoint, we are keeping a very close monitoring on this evacuation so that we can reduce in case of any delays, we can reduce our

capital cost on this impact or

because of the delay.

And, in case there is even a possibility of a week or two or a month coming earlier, we are in a position to utilize full capacity on it. So, we keep a very close watch on it, as well as the current estimates is concerned for the coming up 7 GW. We do expect by end of this calendar year.

Q - Swetha Rakhecha

Great. Thank you. Thank you so much.

A - Baiju Joshi

Thank you. We have a couple of questions from Anuj Upadhyay in the Q&A box. First is, is it fair to assume there won't be any open capacity for the targeted 50 GW capacity except for infirm power?

A - Ashish Khanna

50 GW is too far, but, yes, you are right. As the strategy goes, we are going to de-risk ourself as we have started now.

A - Baiju Joshi

Right. And, secondly, on the PPAs with AESL, is it based on similar terms as with SECI bidding or on take -or-pay basis? Also for capacity going ahead that you plan to sign with AESL, what will be the terms?

A - Ashish Khanna

Absolutely. It's on an arm's -length basis. Followed the standard PPA guidelines of SECI.

A - Baiju Joshi

Right. We have next question from Bhavik Shah in the Q&A box. What is the Capex guidance for FY '27 and '28? Also, is the transmission capacity of additional 7 GW coming on stream by September 2026 on track?

A - Ashish Khanna

I think the second question, Bhavik, we have already addressed with respect to additional capacity of 7 GW. Saurabh, can you come up on FY '27?

A - Saurabh Shah

So, see from a Capex perspective, the FY '27 guidance is about INR42,000 crores of Capex to be done for FY '27 because we are looking at about 5 GW of expansion in RE and 10 GW plus we want to reach as a cumulative capacity in batteries. So, from that angle, it would be that, in that range.

A - Baiju Joshi

Thank you. We'll take the next question from Shirom Kapur. Shirom, please go ahead with your question.

Q - Shirom Kapur

Hi. Thanks for the opportunity. I just want to clarify one thing. The 5 GW capacity addition target in FY '27, does that include the 500 MW PSP that is expected to come up?

A - Ashish Khanna
No, Shirom. That -- the BESS capacity and the pump storage capacity is excluding.

Q - Shirom Kapur
Okay. Got it. And just, secondly, on the realizations that you are getting on the infirm power, do you have -- is that sold on the merchant market? So, for 1Q, could you share what the average realizations would have been?
A - Ashish Khanna
Yes. I think, Shirom, the current is in line with what the merchant power is selling through, including the RECs. It varies, but it is in the range of INR2.5 per unit.
Q - Shirom Kapur
Okay. Understood. Yes. Thank you, sir.
A - Baiju Joshi
Thank you. We have a couple of questions from Bhagya Biradar.
Congratulations on a good set of numbers. First question is 10 GW plus hours of battery. How should we think of phasing over the course of the year? And question two is on economics. How should we think of cycles and unit economics through the course of this year?
A - Rajat Seksaria
Yes. Hi. My name is Rajat Seksaria. I look after the Battery Energy Storage Systems business. So, I think the phasing question, you need to realize that battery energy projects are relatively new in India. So, there is a deep commissioning phase and a stabilization phase. That is why we are not giving specifically quarterly guidance on when we would get commission.
All I can tell you, at this point in time, the projects are at a relatively advanced stage of construction, and we may start commissioning activities very soon, but we are not in a position to tell you from quarter -wise guidelines on commissioning, but, yes, it will certainly be in the FY that we have committed. We are on tra

ck for
that. And we are trying to see how we can further improve the timelines on that, but, yes, we are relatively advanced and on track for that FY '27 targets.
I think the second question you asked is about the unit economics. I think the way to look at it is, fundamentally, the storage project works on an arbitrage model, right? So, you are able to store power when it is relatively cheaper, as Ashish just mentioned, let's say around INR2.5, and then you are able to monetize that during evening hours when the market gives you better prices.
And I think the way we have gone about it is looked at the trends for last 36 months, 24 months, 12 months, and arrived at those numbers, so that they tend to be anywhere between INR4 to INR5 is the arbitrage that you tend to get for these projects, and they are economically viable arbitrages on which we are working.
So, you should typically look at unit prices. Yes, cycle does also come into play. But I think there will be one or two years before we would know whether we are able to do one cycle more than one cycle, how much more we are able to do because that's a very dynamic situation on whether we are able to do cycle in the night time. So, yes, that's something which we are studying and hopefully we'll have better data by the next call.
A - Baiju Joshi
Thank you, sir. We'll take the next question from Dhruv Muchhal. Dhruv, please go ahead with your question.
Q - Dhruv Muchhal
Yes, sir; thank you so much. Sir, earlier we had a strategy that we'll go ahead and commission projects even though on a merchant basis so that we can optimize on the transmission cost. So, that whenever the opportunity arises we have that transmission arbitrage also.
Like, for example, what you did last year and for the last two years. So, does that strategy still continue in the new arrangement, or your commissioning of some of the projects will now align with what the --off-take requirement from, say, for example, Adani Energy is?
A - Ashish Khanna
No, I think -- so the strategy remains to optimize all costs and get the maximum profits on it. So, that's the overall strategy which we have. Coming back to your question in particular, you have to appreciate the fact that our new projects which are going to do across, we are taking into consideration how the evacuation is mapped, when is it likely to come, and that's how our project strategies are as of now.
Taking into consideration the PPA requirements, which we have already signed on and our commitments on delivering the same. And, of course, from the transmission part, it is there, but you also have to appreciate that,

in the last one or two years, there has been certain policy interventions or waiver which were going off on the subsidy part, whether it is with respect to the ISTS charges or with respect to ALMM versus ALCM.
That has also necessitated certain investment from our side, because then, on those projects being commissioned within the timelines, for the next 25 years, we have the advantage of those subsidies which were available to us.
So, all this is taken into consideration when we have this annual five-year plan with us. But, yes, what you are saying, those optimizations will always remain in mind when we strategize. And, it is irrespective of whether it's a PPA or AESM, the idea is to have a cost optimization, getting the maximum returns on our investment.

Q - Dhruv Muchhal
Got it. No, that's helpful. And so the second question at a macro level, what we are observing is that the rooftop market has picked up quite meaningfully. You are seeing installations of 8 GW last year and probably this 1Q itself is about 4 GW or 3 GW, analyzing about 12 GW addition[ph].
How should we think of this? Is this to some degree eating away the market potential f

rom the utility segment?
Because at some point demand is what it is, and somebody else is taking away that market share and can have some implications for future PPAs from the industry, I mean from the DISCOMs and others. I mean just trying to visualize how should we think of this?
A - Ashish Khanna
Sorry, I think it is, if you look at India's energy demand, especially the electricity demand, that's been growing, it is in line with our GDP growth. On that growth, on the trajectory and how the renewable energy itself is proving as a very sustainable and a cost-effective electricity source, we don't foresee that distributed generation of a rooftop is going to disrupt the overall market of energy requirement in this country.
It is -- I think both can sustain its growth in its own selves, and we are seeing -- and then you also have this element, while the solar energy has certain role to play during the daytime, you have evening peaks and night and early morning requirements, too, which a rooftop at someone's house or C&I segment will not be able to sustain.
So, in our view, we see it as a very good sign in the way people are embracing clean energy. And we don't foresee any major challenge to utility segment, C&I, and those who are primarily bigger consumers of energy per se.
Q - Dhruv Muchhal
Got it. And, sir, last question. On the battery point, you had mentioned -- I mean your team mentioned that the scheduling, the visibility of scheduling at a granular level is not as probably accurate. I'm just trying to understand why does that happened?
I thought if you have transmission connectivity, generally these are, kind of set equipments. So, I thought there should be a better visibility versus, say for example, a typical wind or solar project, but it seems a bit different here.
A - Ashish Khanna
I think Dhruv, you took scheduling to a different understanding when we were talking about scheduling is that there is a plan on how much GW -hour is going to be installed in a particular month. The first quarter itself should give the market enough confidence on the capabilities of Adani Green to execute an operationalized project. We have a target of a 10 -plus GW basis.
Let me also add here that this capacity itself, we are virtually half of the total operational capacity as well as battery storage is concerned in this country. By the end of the year, we are going to be even more than two-third of that. When we are speaking of a scheduling point, it was with respect to, yes, it -
- many times a quarter may not be 10 divided by four. It can be plus 500-plus MW-hour or things like that. That is where the scheduling was being spoken.
Q - Dhruv Muchhal
Got it.
A - Ashish Khanna
And we also have to look how the second cycle plays into consideration.
Q - Dhruv Muchhal
Got it. Sure, sir. Great. That's helpful. Thank you so much, and all the best. Thanks.

A - Baiju Joshi
Thank you. We'll take the next question from Abhishek Khanna. Abhishek, please go ahead with your question.
Q - Analyst
Hi, sir. Just one question on the industry more broadly, but, like you said, we are still in the early phases of battery installations for the country as a whole and even for Adani, let's say.
But I think there is a risk of some of these battery fires, unfortunately, like we've seen across the world. I think there was one such incident that happened with one of our competitors also, thankfully not very severe. But is that a real risk? One second, if that is the case, do we get any warranties or a cover from the battery provider or the PC guy or is there a third -party insurance for that that is available and we are taking?
A - Rajat Seksaria
So, Abhishek, I think I'm glad you asked this because we also come across this news reports and videos circula

ting on various WhatsApp groups. So, let me clarify that it may be a competitor, but they are fellow industry players.
So, I think what has been circulating in the video is a bit misleading. So, what got fired was not the batteries, right? What got fired actually were what is called PCS or inverters because there was what is called IGBT failure. While that itself is not a good thing, but that's not very uncommon. It has happened in the past. So, batteries per se have not got fired is another component which can happen in any other plant. It can happen in solar and other plants. So, it's not a battery fundamental risk.

Yes. You are right. The energy density of LFP is so high that you are packing in a lot of energy in the 20 -foot container. So, you have to maintain a lot of safety protocols. I can only tell that we have invested in technology and vendors with the highest levels of safety norms, some of them actually comparable with what goes in Europe.
But we are constantly monitoring both from a data point of view, asset integrity point of view, and as and when there is any further action needs to be taken, we will take. But that particular incident, I will categorically clarify, is not a fire in the battery system. It is actually a fire in a different component --
Q - Analyst
PCS.
A - Rajat Seksaria
PCS, yes.
Q - Analyst
Got it. And the second part of the question, of course, we will -- everyone takes precautions like they would. But is there any insurance that anyone gets, or any guarantees or warranties that you do get from the supplier, or any insurance service provider out there?
A - Rajat Seksaria
Yes, absolutely. So, insurance, like it is covered for any other equipment, it is covered by standard insurance policies, including for battery projects.
There is a very rigorous process by which the insurance agents evaluate and then they underwrite the insurance policies. And all these projects of battery (Technical Difficulty) technical specs, they are designed for specs of a particular location in terms of temperature, weather, and our type of operations. So, then, of course, our OEMs are all reputed Tier 1s. So, we are not expecting any issues on them.
Q - Analyst
Got it. No. Of course. Okay. That is helpful to hear. Thanks a lot. That's all.
A - Baiju Joshi
Thank you. We'll take the next question from Nikhil Nigania. Nikhil, please go ahead with your question.
Q - Nikhil Nigania
Hi. Thanks for taking my question again. Just continuing again on the C&I space given it a significant change. A, wanted to clarify, do these contracts have any exit or termination clauses in case AESL is not able to sell that power at the right price? So, either party, do they have any termination clauses? If there are, is it very similar to a SECI contract?

A - Ashish Khanna
So, I told you, Nikhil, these contracts are on the basis of the SECI PPA, the grander PPAs. And it is --there is no termination on convenience per se in those contracts. These are contracts which has been signed between parties.
And I would like to reiterate here that these are primarily signed from AGEL's standpoint to de-risk the ups and downs of the market and get the predictable return for which we have built our assets. And these contracts fully substantiate and honor that strategy.
Q - Nikhil Nigania
Makes sense. And if I may just add one more related question, I think as you mentioned earlier, AGEL strategy to early commission these assets to take benefit of ISTS waivers, ALMM waivers, et cetera. Was a big advantage we had. But that advantage of that INR0.50 saving in transmission cost, where does that sit now after this? Will it still be with AGEL? Will it be with AESL?
A - Ashish Khanna
I'll tell you, from AGEL's standpoint, we have de -risked any pluse

s and minuses on that part. And it is very
difficult to predict how these advantages will pan out in future in the next 25 years. And I think that is the risk which AESL has taken. AGEL has been insulated from it. We are, this is the arm's length transaction, are getting the predictable return for which we have built these projects.
Q - Nikhil Nigania
Perfect. Understood. And just one last question then on the execution side, given that's the entire focus now. So, Khavda has been, I mean, experience for us, it's already up to 10 GWs, has been mentioned. Are there any other similar large sites that we are evaluating which could come up in the near term?
A - Ashish Khanna
Of course. Nikhil, we are seriously evaluating many large sites and are working on it. Khavda experience has been phenomenally good for us and given us the confidence of executing and operationalizing these large projects.
And I think, basis this experience has given us immense confidence on even working on those. So, you are right, we are working very seriously towards other large sites too at the places where the radiation levels are as good as possible in this country.
Q - Nikhil Nigania
And would they be to a comparable scale to Khavda, or anything in that ballpark, or?
A - Ashish Khanna
It's difficult to say the scale to which it will be, but, yes, it will be very, very large sites which we are evaluating,

and as and when it comes into picture, we are bounded as a public company to declare the same. And you will be the first one to know about this.

Q - Nikhil Nigania

Perfect. Thank you. Those are my questions. Thanks a lot for answering.

A - Baiju Joshi

Thank you. Reminder to the participants to use the Raise Hand feature to ask any questions or use the Q&A box directly to type in their question. We'll take a follow up question from Shirom Kapur. Shirom, please go ahead with your question.

Q - Shirom Kapur

Hi; thanks for the follow -up. Just quickly a bookkeeping question on BESS. So, you highlighted that you've added about 1.97 GW -hour capacity in 1Q. Does that imply that your closing capacity at the end of FY '26 would be about 1.6 GWs just based on the math? Because your previous presentation at the end of 4Q had mentioned it was 1.4 GW. So, I just want to clarify that.

A - Saurabh Shah

So, if you had seen it was like installed as well as commissioned executable capacity was mentioned. So, installed capacity was 1.6 GW, and this year, this quarter we have installed about 1.9 GW. So, the total capacity installed is at 3.5 GW -hour.

Q - Shirom Kapur

Okay, got it. Thanks for that. And just, secondly, on the BESS, so your presentation mentions you have facilities available for 2 GW -hour under construction best projects. So, 3.5 GW is already commissioned, 2 GW-hours facilities are available.

So, balance 4.5 GW-hour that you're looking to add, are there any risks on delays there? And, in terms of the supply chain also just want to understand, is the supply chain secured on these BESS projects? Is there any risks to that as well? Thank you.

A - Saurabh Shah

Shirom, I think, if you read it well, we are committed to have 10-plus GW in this financial year, besides what has happened in the past. And, as we speak, we are committed, and we are very clear to achieve this. We don't -- while the risks are always there, but, with our experience of the past, we don't foresee much risk in achieving these capacities in this financial year for sure.

Q - Shirom Kapur

Okay. Understood. And just if I can ask one last question on the realization profile. I believe this question was asked earlier, but I may have missed the answer. Just want to understand, the realization of the tie-up with AESL would be in line with the long-term PPAs that we already have tied up? Wou

ld that understanding be
correct?

A - Ashish Khanna

Absolutely, Shirom. It is definitely in line with the long-term PPAs which are there.

Q - Shirom Kapur

Okay, understood. Thank you so much.

A - Baiju Joshi

Thank you. We have one question in the Q&A box from Bhavik Shah. What is our Cap ex cost of batteries? And, similar to what you answered, how many years of warranty or guarantee do they come with?

A - Rajat Seksaria

The cost, of course, is a function of so many moving pieces: rupee, dollar exchange rate, and other things. But, at this stage, I think a reasonable good thumb rule would be INR1.5 crores per MW -hour of installed capacity. So, that's a good number to work with. And it may change a bit depending on whether it's a two-hour system or a four -hour system, but let's not get into that nuances yet. But, right now, I think INR1.5 crores is something which we can work with.

A - Baiju Joshi

Thank you, sir. Just a final reminder to the participants for any questions. If there are no other questions, I'll hand over the mic to the management for any closing remarks.

A - Saurabh Shah

Yes, thank you, everyone, for coming on the call. We look forward to continued interest in Adani Green Energy. Thank you, Macquarie, for arranging this, and thank you, all, and hoping to see you next quarter. Thank you.

A - Ashish Khanna

Thank you.
