Sub: Transcript of the Analysts/Institutional Investors Meeting / Call on Unaudited Financial Results for the Quarter and Nine months ended December 31, 2025

Dear Sir,

Pursuant to Regulation 30 of the SEBI (Listing Obligations and Disclosure Requirements) Regulations, 2015, please find enclosed the transcript of the conference call on Unaudited Financial Results (Standalone and Consolidated) for the Quarter and Nine months ended December 31, 2025 held on Friday, 30th January, 2026.

The above information is also available on the website of the Company www.websolenergy.com .

This is for your information and records.

For WEBSOL ENERGY SYSTEM LIMITED

Raju Sharma
Company Secretary

"Websol Energy System Limited Q3 and 9M FY26
Earnings Conference Call"

January 30, 2026

MANAGEMENT : MR. SOHAN LAL AGARWAL - MANAGING DIRECTOR
MRS. VASANTHI SREERAM - CHIEF TECHNICAL

OFFICER
MS. SANJANA KHAITAN - EXECUTIVE DIRECTOR
MR. AMRIT DAGA - CHIEF FINANCIAL OFFICER

Websol Energy System Limited
January 30, 2026

Page 2 of 21

Moderator: Ladies and gentlemen, good day and welcome to Websol Energy System Limited Q3 and 9M FY26 Earnings Conference Call.

As a reminder, all participant lines will be in the listen-only mode, and there will be an opportunity for you to ask questions after the presentation concludes. Should you need assistance during the conference call, please signal an operator by pressing star then zero on your touchtone phone. Please note that this conference is being recorded.

I now hand the conference over to Ms. Anvita Raghuram from Churchgate IR. Thank you and over to you, Ms. Anvita.

Anvita Raghuram: Thank you, Michelle. Good evening, everyone, and a very warm welcome to Websol Energy System Limited Earnings Conference Call for Q3 and 9M FY2026. We appreciate your time this Friday afternoon, and thank you for joining us.

Today, we have with us the senior management team of Websol Energy System represented by Mr. Sohan Lal Agarwal – Managing Director; Mrs. Vasanthi Sreeram – Chief Technical Officer, Ms. Sanjana Khaitan – Executive Director and Mr. Amrit Daga – Chief Financial Officer.

We will start the call with opening remarks from Mr. Agarwal, who will provide an overview of the quarterly performance and key developments during the period. We will then open the floor for a question-and-answer session. Please note the Earnings Presentation and Press Release for the Quarterly Results have been uploaded on the Stock Exchange and the Website and can be downloaded.

Now, I will request Mr. Agarwal to open this conference call. Over to you, sir.

Sohan Lal Agarwal: Good afternoon, everyone, and thank you for joining us on Websol Energy System Q3 FY2026 Earnings Call. It's a privilege to address all of you today and share an overview of the Company's operational and financial performance and achievement during the quarter.

For Q3 FY2026, we delivered a strong set of results with Revenue from Operations of Rs. 261 crores, reflecting a 77.2% Y-o-Y increase. EBITDA for the quarter was Rs. 106 crores, yielding a margin of 40.8%, and PAT was Rs. 65 crores, with a margin of 24.8%. The growth was primarily driven by the commissioning of Cell Line-2, which contributed to higher capacity utilization and overall production output.

For 9M FY26, we achieved revenue from operations of Rs. 648 crores, reflecting a 61% Y-o-Y increase. EBITDA for 9M FY26 was Rs. 282 crores, with a margin of 43.6%, and PAT was Rs. 179 crores, representing a margin of 27.3%.

As of 31st December 2025, net debt stood at Rs. 89 crores. The Debt/EBITDA ratio improved to 0.47x, from 0.60x in FY25. I am also pleased to mention, gentlemen, that CRISIL Rating has

Websol Energy System Limited

January 30, 2026

Page 3 of 21

assigned Websol Energy System a BBB+ stable rating for our cash credit and term loan facilities.

This rating reflects our ability to manage debt effectively while executing our growth initiatives.

As of 31st December 2025, our order book stood at approximately Rs. 1,150 crores, reflecting a balanced mix across both modules and cells. Modules accounted for about 57% of the order book, while cells contributed the remaining 43%, providing visibility across our manufacturing segments.

From an operational perspective, the quarter reflected disciplined execution across our manufacturing operations. Phase-1 of our cell manufacturing operations continued to operate at a high utilization, with Cell Line-1 achieving 97% utilization. Cell Line-2, commissioned in September 2025, reached a utilization level of 54% during its ramp-up phase, reflecting steady stabilization within a short period of commissioning. On the module side, capacity utilization improved to 64% in Q3 FY2026.

The commissioning of the second 600 MW Mono PERC Cell Line reflects the Company's ability to execute projects within planned timelines and funding frameworks. The line was commi

ssioned within a record-breaking time of less than one year and was fully funded through internal accruals. This line has already begun delivering high-efficiency cells, with peak cell efficiency recorded at 23.6% within only three months of commissioning.

Building on our execution across Phase-1 and Phase-2, we remain committed to being an integrated solar cell and module manufacturing. Our focus is on scaling capacities in a sustainable and time-bound manner, supported by our long-standing engagement with solar

technology and a deep understanding of the manufacturing process.

In line with this strategy, we continue to progress on our next phase of expansion. During the quarter, the Company received approval for its proposed 4 GW integrated solar cell and module manufacturing facility at Andhra Pradesh. Land allotment for the project has been completed, and a tailor-made incentive package, including investment-linked subsidies has been approved by the Andhra Pradesh Economic Development Board, which is expected to support overall project economics.

Alongside these expansion plans, the Company's fundamentals remain supportive of its growth strategy, enabling future investments to be funded through a combination of internal accruals and debt. In parallel, a dedicated team has been constituted under the leadership of Mrs. Vasanti Sreeram, Chief Technical Officer, to support the upcoming phase of execution.

We continue to progress on our backward integration strategy to strengthen control across the solar manufacturing ladder chain. During the quarter, we entered into a memorandum of understanding with Linton, a global provider of photovoltaic ingot, and wafer equipment technology, to explore the feasibility of establishing local manufacturing of PV ingots and wafers in India. At present, the focus is on technical evaluation, research and development, and

Websol Energy System Limited

January 30, 2026

Page 4 of 21

finalizing timelines and project details in collaboration with Linton. This initiative forms part of the Company's broader strategy to deepen integration across the value chain.

The solar sector continues to operate within a supportive policy environment in India, with government initiatives aimed at strengthening both demand and manufacturing. On the demand side, policies supporting renewable energy adoption across utility-scale rooftop and emerging applications continue to drive solar installations. At the same time, measures such as the PLI scheme and the Approved List of Models and Manufacturing frameworks are encouraging manufacturing capacity creation and deeper localization across the solar value chain.

In summary, gentlemen, we are excited about the progress we have made this quarter and remain committed to executing on our growth strategy. As we continue to expand our manufacturing footprint, strengthen our supply chain, and integrate advanced technologies, we are confident that the Websol Energy System will be able to capitalize on the growing opportunities in India's solar energy market.

Thank you very much.

Moderator: Thank you very much. Ladies and gentlemen, we will now begin with the question-and-answer session. The first question is from the line of Aman Soni from Nvest Analytics Advisory LLP.

Aman Soni: Thanks for the opportunity. I have two questions. One is on the margins front. This quarter, obviously, we are reporting a bit consistently good margins. Looking at the industry landscape, where the cells capacity is rising as well as the module capacity and we are also speaking about the further capex, so how long do we see these margins to be sustainable going ahead?

Sanjana Khaitan: Thank you so much for your question. We have reported margins of 40% plus in the last few quarters. Given all the capacities which have been announced, we do foresee that there would be some dip in the margins to more sustainable levels in time to come. However, given a

II the

capacities that have been announced, we feel that it would take some time for such capacities to come on ground. Even when such capacities are installed, as per our experience, given that we have been doing this for 30 years, we feel ramp-up and operating the line is not very easy. Hence, though installed capacities may increase in the announced time frame, which also we feel may be a little difficult, in terms of operations, from a utilization and efficiency perspective, we feel it would take time for those capacities to add up as announced. So, definitely 2-3 years we foresee that margins should remain at the level that they are.

Aman Soni: Sorry, what time frame did you mention for the sustainability of the margins?

Sanjana Khaitan: Definitely there maybe some sort of 3%-4% variation, but otherwise the level we are at right now, we should continue at that level. Also, I would like to point out that given our order book has essentially been just cells until recently, with addition of modules as part of our product portfolio, the blended margins would look a little lower than the margins we reported last few quarters.

Websol Energy System Limited

January 30, 2026

Page 5 of 21

Aman Soni: Understood. So, for this particular year and for FY27, what kind of topline do we see and what kind of absolute bottomline? Because I am asking for the absolute bottomline, because people are not giving any guidance in terms of certainty of the margins that I understand, but I think some base level of margins we should be having in the mind. So, if you can give some color on what kind of absolute PAT and what kind of absolute topline are we projecting, based on our

capacity for this year as well as next year?

Sanjana Khaitan: Correct. So, we do not want to provide any guidance or comment on forward-looking projections. However, the ongoing capacity ramp-up, improved utilization of our module line and the healthy demand environment would kind of indicate a positive outlook for the growth opportunity. And as I suggested, given that the capacities coming up would take longer than probably announced, I would believe that the margins would remain at the current levels for some time.

Aman Soni: Understood. And secondly, on the supply chain front, for cell manufacturing, we need silver paste and a little bit of silver also, right? And looking at the prices of the silver, how are you managing this commodity effect, the commodity inflation that we are facing right now? Are we able to 100% pass it on to the end customer or how is it going to be?

Sanjana Khaitan: Correct. So, silver prices have definitely increased significantly during the current financial year. And to mitigate this input cost volatility, we have secured advanced procurement of the silver requirement, providing near-term cost visibility. Also, our technical team is working on a silver consumption reduction project, wherein we have already approximately reduced 25% of the silver that we use for our production process through process and technology optimization initiatives. So, we are definitely working on bringing these consumption levels down further. Moreover, we are also evaluating potential alternatives to silver and we are closely monitoring these developments to manage long-term cost competitiveness.

Aman Soni: Understood. Again, like on the margin front, just to get the understanding better, it should not be like we are doing a topline of 200, maybe down the lines of 2 to 3 years. We are doing the topline of Rs. 2,000 Cr. Do you feel like on Rs. 2,000 Cr., the situation will be like that the bottomline will still be more or less marginally increased? It will be like that only or maybe we will be still able to manage, like for example, topline we may grow by 30% and still we will manage the bottomline to grow maybe not by 30% but by 20% at least. Will it happen like that? What is in your mind in terms of your experience in this industry? Because we are seeing a lot of players are entering into the industry. So, even if it should not be like realizations suddenly fell down and then profitability gets significantly impacted over this. So, how do you look at this?

Amrit Daga: So, Amrit this side. As we have already told, we do not see any significant margin reductions on account that we do not believe that the capacity ramp up will be happening so soon. We believe that it takes time to install the capacity and to ramp up the production. So, we do not foresee any significant dip in the margins. Some moderation is likely because the industry is maturing, but we do not foresee a very significant dip in the margins and are confident of the Websol Energy System Limited
January 30, 2026

Page 6 of 21

levels that we are maintaining. We will be able to maintain one of the highest industry margins that we are confident. But to give an exact margin percentage is very difficult, because it is a dynamic industry.

Aman Soni: Understood. That is from my side sir and all the best for the future.

Sanjana Khaitan: Thank you.

Moderator: Thank you. The next question is from the line of Amit Mishra, an Individual Investor. Please go ahead.

Amit Mishra: Hello. Good afternoon everyone. Thank you for giving me the opportunity to put up my questions. Firstly, I would like to say that this is our first maiden concall which is a very good start to have a direct dialogue between management and investor fraternity. It is very much appreciated. So, thanks for that. Also, I would like to congratulate Mr. S. L. Agarwal and the whole team for their amazing work for the last two years to turn around the Company. It has given very strong foundation for further capex in Andhra Pradesh which we are starting now. So, very happy on that front. I will start my questions now. I have three questions in total. So, first question is related to capex for Andhra Pradesh project. I heard that land allotment formalities have been completed now. So, going forward, we want to understand about Phase-3 funding which is around Rs. 1,700 crores. So, what would be the source of this funding? Internal accruals, debt, equity? Can you give some breakdown so that we can understand how would it be sourced?

Sanjana Khaitan: Correct. So, basically on the funding part, as you said, we are projecting a cost of around Rs. 1,600 crores to Rs. 1,700 crores for Phase-3 which is the cost for an integrated 2 GW Topcon cell and module manufacturing facility. As of now, we are hoping for a 70:30 debt equity mix for this project wherein for the debt part, we are already in touch with Financial Institutions and Banks for around Rs. 1,100 to Rs. 1,200 odd crores. In fact, our discussions are at an advanced stage and we are hoping that we can achieve financial closure by around March-April in order to ensure that our timelines for this project do not move. With respect to the equity part, which should be around Rs. 500 crores, I think we are very comfortable from a margin perspective that

we would have those cash flows to pump this money as our internal accruals. So, we are not planning to raise any money at the moment from the market. We would be funding the same through our accruals.

Amit Mishra: So, there won't be any QIP or pref fundraise?

Sanjana Khaitan: At the moment, we are not planning for that. There is a warrant conversion which is happening at the promoter level. So, that would be completed by around February-March. But apart from that, we are not planning any other sort of equity raise for Phase-3. For Phase-4, we are hoping, given successful operations of Phase-3 and our current lines, we would be more than comfortable to fund the same through accruals and very minimal debt raise. So, there is no equity roadmap as of now.

Websol Energy System Limited

January 30, 2026

Page 7 of 21

Amit Mishra: Understood. So, there won't be any diluti

on except the warrants which are coming in?

Sanjana Khaitan: Correct.

Amit Mishra: The question on the debt part, I would like to hear your thoughts. Because we have our assets as collateral for last debt from IREDA, including pledged promoter's holding. So, are we going back to IREDA? Do we have some understanding to extend the loan facilities based on increased asset base, etc.? So, I wanted to hear that how would we be able to secure that debt of Rs. 1,100 crores-Rs. 1,200 crores?

Sanjana Khaitan: Correct. So, on your first question with respect to the loan taken from IREDA, we have pledged a sizeable amount of shares to IREDA for the first sanction facility for our current Mono PERC cell and module lines. We are actively working to get these shares released and just to give you the exact net debt amount right now on this fund is around Rs. 100 crores. For the upcoming project, yes, we are in touch with IREDA for this project. However, we are already having discussions with respect to what the collateral and security would be. Because we will be doing through our wholly owned subsidiary, Websol Renewables, we are hopeful that there would be no pledge of shares required for this loan and that we will be able to get the shares released potentially in the next few months on account of the previously sanctioned facility. We are working quite hard on this and we are hopeful that the shares should be released soon.

Amit Mishra: Very good. Thank you. Second question is on the, last quarter we faced some delays in material offtake because the prices were going down in that quarter from let's say September to December. We saw a decline in solar cell prices. Now, are we seeing reversal because the prices have been firming up for some time due to metal upsurge. And also China is lifting this 9% rebate on their exports with effect from 1st April. So, are we witnessing that clients are actively approaching you to take off earlier than expected deliveries which are planned later?

Sanjana Khaitan: Yes, correct. Absolutely right. Last quarter there was some downward push on the price, which I think was an industry phenomena, and there was some sort of inventory piling up which took place because of that. However, we feel it was also on account of some temporary liquidity constraints which were experienced at the customer end which led to deferment of the scheduled offtake. However, what our understanding is that the same has occurred in the industry before and given our order book visibility we feel that this level would normalize in the current quarter. Also, given the rise in silver price and the rebate in China, there will be some increase in cell and module prices as well, and India is already showing higher prices than last quarter.

Amit Mishra: Okay, so that's good. So, the momentum is coming back. The third, last question is regarding long term visibility on leadership of the Company. I know Mr. S.L. Agarwal has given so many years to this company. I would like to know what would be the leadership like when sir actively stops active work in the Company. I assume already Sanjana ji is in place, Vasanthi ma'am is there with a very brilliant team who is doing a very brilliant job. But we would still like to hear from management if the plan is different. Also, if you can just develop on what kind of second level management or leadership for AP project because the construction timelines are 5-6 months

Websol Energy System Limited

January 30, 2026

Page 8 of 21

and I know it takes a good project manager to see us through to stick with the time. So, if you can develop on the leadership in the Company as a whole, I would be very appreciative.

Sohan Lal Agarwal: So, Amitji, while I continue to remain fully active and engaged in the business, driven by my long standing association with the Company and commitment to the industry over the past three decades, I recognize that succession pla

ning is definitely a critical pillar of long term

organization stability and governance. The Company is actively working towards further strengthening professional management structures to ensure seamless leadership continuity. I

would also like to highlight that Mrs. Vasanthi Sreeram, who has been with the Company last 30 years and is serving the organization in her capacity as CTO, is leading the Company's technology strategy and continues to anchor all technology-led initiatives ensuring sustained competitiveness and innovation on the technological front. Ms. Sanjana Khaitan, who has been associated with the Company for the past three years and is actively involved in managing key business and operational functions to the best satisfaction of mine, is well positioned to take on higher leadership responsibilities in time to come and will be supported by a strong professional management team. I would like to reassure shareholders that the succession process is being implemented in a structured and phased manner and will not create any disruption to the Company's growth, trajectory on the strategic direction. So, Sanjana is quite young now, so she can take up a longer time, not to worry about it.

Amit Mishra: Sir, we want you to continue in the Company for as long as you want.

Sohan Lal Agarwal: I have already informed almighty to give me another 50 years to continue here.

Amit Mishra: Sir, on the AP project theme, can you elaborate a little bit because it's a large capex so we investors just want to see how the Company is being prepared to take that challenge. It's a new place, it's out of our comfort zone also.

Sohan Lal Agarwal: Websol has always been taking challenges like this, so not to worry about it. If you see the second phase line also, we have done it with our own cash flow. We have not taken any debt and we have also been repaying the debt of IREDA. So, I think the cash flow is sufficiently there and with our good performance and payback in time to IREDA, they are quite confident that we can take up the further debt. I do not feel that there should be a problem. Let the time come, we will see if any issue comes in and we will resolve it in a proper manner.

Sanjana Khaitan: With respect to the team, Ms Vasanthi has also dialed in. She can just inform a little bit about the status of the project because we have been actively creating a separate team for this under her leadership. I request her to share more details.

Vasanthi Sreeram: Good afternoon, everyone. We have an experienced team ready in house. We are training another set of people under them so that they can take care of the present line and then the senior team members can handle the new project in Andhra Pradesh. So apart from this, we will be training and inducting more technical people, maybe a month or two before the project actually starts there. We will be training them in house, in our present facility, so they are well trained and
Websol Energy System Limited
January 30, 2026

Page 9 of 21

understand how to execute the new project. Apart from that, we are talking to our technology providers also, if we can send a small team of people who they can get trained when the equipments are in the final phase of assembly, so that also we are already in the process. We will be doing that as well.

Moderator: Thank you. We will take the next question from the line of Shashank Jha from SB Capital. Please go ahead.

Shashank Jha: Ma'am, can you give your distribution between DCR and non-DCR?

Sanjana Khaitan: So basically for cells right now, through our 1.2 GW line, we are manufacturing DCR cells. Out of that 600 MW, which is one line, we are completely using captive into our module production and producing DCR modules. We do not have any Non-DCR exposure at the moment.

Sohan Lal Agarwal: Non-DCR is importing cells from China and then fabricating the panels in India. That is what is called a Non-DCR pane

I. So, Non-DCR is a product where cells are being brought from outside the country. Whatever cells we produce in India is DCR.

Shashank Jha: Okay and one more thing it is regarding your EBITDA margin. So EBITDA margin like in last quarter was 45%. Here it is 40% and so my question here is that like all other companies are also developing cell plants, right? So is your 40% margin sustainable like one of the top here Emmvee, Emmvee is having margin of 35% so 40%-45% looks very high. So first thing is what is the reason behind this high margin and is it sustainable and if not can you give some sustainable margin over a longer period of time?

Amrit Daga: Your first question, Shashank, the margin depends on how much you are blending between cell and module. So if you notice that we are uniquely positioned in the market, in that, our cell capacity is 1.2 GW and our module capacity is only 550 MW. I would not like to comment on other players, but most of the players in the Industry are having higher module capacity compared to cell. So that is the reason behind getting the highest margin in the industry. And regarding the margin sustainability, we would like to reassure that the cell line is a highly technological business and it takes time to install the plant and also it takes time to ramp up the plant.

Shashank Jha: Sir, sorry to interrupt. My question here is that, sooner or later most of the companies will have cell and module in the similar line and those having higher capacity may be either using it for export or buying some non-Chinese cell so my question is that your competition is going to increase in DCR market when all other companies will have cells in their in-house. So will you

be able to sustain this margin at that time? And you will also have similar line up like sooner or later you will have around 5 GW of module and cells? So at that time will you be able to sustain this margin?

Amrit Daga: So we have already stated when we were discussing the long-term sustainability of margins. We are expecting some moderation in margin, but we do not expect any sharp decrease compared to Websol Energy System Limited
January 30, 2026

Page 10 of 21

the present level. There might be some moderation in the margin, we are not denying the fact, because the market is maturing. However, margin also depends on many factors - how you are operating your line, how you are managing your expenses, how efficient you are in terms of cell efficiency. So, the margin also varies on many factors.

Shashank Jha: Got it. Sir, one last question regarding order book. So your current order book is giving visibility of one year. So any bid pipeline going on, so how is the order book pipeline looking like at the current moment?

Sanjana Khaitan: So we are already looking at the order book as of 31st December 2025, which stands at approximately Rs. 1,150 crores. This comprises of whatever firm purchase orders we have received until now. We do also have repeat orders which we haven't included in this and there are certain negotiations which are ongoing as well. Once we are able to close on the same, we will be able to disclose. So definitely, with the ramp up of our new cell line and with increasing utilization of the module line, we will have some headroom to be able to take on more orders.

Shashank Jha: Okay. One last, it is regarding, do you have G12R?

Vasanthi Sreeram: At the moment we don't have, but then we will be ramping one of the lines to G12R by the middle of next year.

Shashank Jha: So your nameplate capacity and effective capacity will be different right now?

Vasanthi Sreeram: As of now, whatever we have mentioned is our present capacity but once we convert to G12R, yes the capacity will increase.

Sohan Lal Agarwal: The size what you are mentioning gentlemen, there are different projects the government are already running. One is the pump, the other is the roof top, the other is th

e solar power park. So

far the pump, there is a fixed capacity of the module that you can't increase much because they cannot use it. If you make a 600W or 700W normally they do not go in the pump, for the rooftop now people are looking for a higher output. One more thing is important that I do see for margin, my observation is that if you look at the recent push by the Government of India that lot of the projects the government has announced are still not fulfilled completely because there is a gap of demand and supply in the DCR market and they have requested all the state governments to kindly look into it and see that these projects are completed. Because still the capacity is not there to complete those projects in a very fast and quick manner. because in rooftop, still there a lot of outstanding projects are there similarly the pumping is also there. Definitely the margins are so high, at the moment it cannot be maintained at that level. I do agree with you, logically it should be levelized because the price of the wafers are increasing. But you have to see why it should come down because you have to also observe to what extent the consumer can accept and absorb the prices economically for their project. That is also very important to maintain the supply chain and the manufacturing industry. So I don't think there should be a big downfall in the margin, it might take some correction in the time to come when the capacity increases, automatically it comes like that. So there is nothing to be panicing in that area in my opinion.

Websol Energy System Limited
January 30, 2026

Page 11 of 21

Shashank Jha: Okay, got it. Sir, one last thing there is a 1.2 GW cell nameplate, how much actual cell is being produced there? I have seen in some companies that they can produce 90% of it nameplate capacity and effective capacity, so in your case how much is it?

Sanjana Khaitan: We have already displayed these numbers in our investor presentation. The first cell line we are currently operating at 97% of the effective utilization level. So the reason the effective utilization is different from the labeled capacity is that some machines have a different throughput and given certain preventive maintenance activities it is not possible to achieve the labeled capacity level.

Shashank Jha : Okay, ma'am. Thank you for answering everything. All the best.

Moderator: Thank you. The next question is from the line of Somnath Saha from B&K Securities. Please go ahead.

Somnath Saha: Thank you for the opportunity. Can you give some idea of the current relation for cell and module both in domestic market and as well as the export scope you have? And also can you give some breakup of the current order book of Rs. 1,150 crores, how much of that you have export potential on that?

Sohan Lal Agarwal: Export order is not possible at the moment you know it very well, because the main market for export was USA and USA already as you know, there are issues still ongoing because of the tariffs that have been announced. So export market is very minimal. However, but the rest of the market is in India and I think further they can give some clarifications.

Sanjana Khaitan: So, as sir said, we do not have any export exposure at the moment. The DCR market seems fairly lucrative at this point wherein prices are at a good level, margins are at a good level. Given that we have additional cells compared to modules, we don't really need to worry about the Non-DCR space. So, our focus is only on the DCR segment right now. We are not concentrating on any export at the moment and the order book we disclosed is all DCR cells and modules. There is no export in that.

Somnath Saha: Okay, understood. Can you give some idea of the realization for the quarter for both cell and module?

Amrit Daga: So the current realization in cell is roughly 14 cents per watt and in the case of module it is 22.5-cents to 23 cents per

watt.

Somnath Saha: Okay, thanks.

Moderator: Thank you. The next question is from the line of Sushil C. Choksey from Indus Equity Advisors. Please go ahead.

Websol Energy System Limited
January 30, 2026

Page 12 of 21

Sushil C. Choksey: Congratulations management of Websol for super performance and very good implementation of Phase-2. So my first question is everybody is asking on margin. Is it possible to indicate that our Cell-2 line is working at a much higher efficiency like the Cell-1 line of 97%, as of today, I am saying just say indicative on January. I am not saying anything more.

Vasanthi Sreeram: We are almost close to operating at the same level utilization. Now it is like close to 90% utilization. I am talking about today's scenario. So we have almost achieved 90% utilization. As far as cell efficiency is concerned, we are at a very top level of 23.4%. So that is where we are.

Sushil C. Choksey: Thank you, Vasanthi ma'am. One other question on that basis. Everybody is asking about cell efficiency pricing, raw material margins and everything, can you indicate I am not hurting any other competitor company, what is the science that our cell manufacturing efficiency is superior to industry or our experience of 30 years is working on our interest? Can you elaborate a bit on that?

Vasanthi Sreeram: Of course, our experience of 30 years is definitely helping us to be among the top players of the industry in India. We are almost matching with the Chinese players. Apart from that we have recruited some very good PhDs who have a lot of knowledge and experience, so that is also helping us.

Sushil C. Choksey: So basically you are saying that we do not have breakage or deficiency in the manufacturing process which gives us higher productivity number, if I am producing say one million cells on a particular time, that one million will have lesser breakage and a higher output per cell what are we producing. Am I right to conclude that?

Vasanthi Sreeram: See, breakage and rejections is one part but then you should be able to utilize the equipment. So whenever there is breakdown you have to be very quick in bringing the machine up and running and we should be able to tune the process in such a way that we are able to produce for every second that the clock is ticking. This caliber our people are having. They have been trained for that. So it is not only the breakage and rejection, which is also one of the lowest that we are having now, but it is not just the breakage and rejection, but also that we are able to get the machine to work at its full capacity.

Sushil C. Choksey: Sanjana, you replied on silver consumption and some replacement and technology updation, do I assume that our silver content in the cell is in a single digit and not double digit like others?

Sanjana Khaitan: So for the silver part of course we have brought down our consumption successively. I do not know what the consumption is for the other companies, but in our case from the level we started at, we have already gone down 25% in terms of the consumption. So from that perspective we are quite confident that we will be able to bring it down more.

Vasanthi Sreeram: We are working on bringing it further down. So another 10% is our target.

Websol Energy System Limited
January 30, 2026

Page 13 of 21

Sanjana Khaitan: So the consumption part is what we are very actively working on to eliminate the possibility of any increase in price affecting us very drastically.

Sushil C. Choksey: Agarwalji, I have a question for you. Your 32-33 years of rich experience from inception of Websol, now everybody talks about only solar module for rooftop and solar parks and otherwise.

Nobody has assumed that our Prime Minister has a vision to make hydrogen hub from India for 5 million ton and 10 million ton. I understand for every million ton you need 20 GW of solar

power.

Sohan Lal Agarwal: You are correct.

Sushil

C. Choksey: Second thing is, Europe if I recall well implemented solar between 1995-2008-2010 when China was not existing in solar play. The entire European replacement market is going to open. India EU FTA has been signed. Besides this whether it is a government scheme of KUSUM, rooftop solar, everybody is deficient, government subsidy in last quarter was not paid, so the solar module even in your inventory is reflecting that you have not delivered. Now European demand may be one year later when our capacity in Andhra is ready. Hydrogen may be FY28, now keeping all this vision in mind, second thing is everybody is focused on China prices on a daily basis, looking at MNRE website on your DCR production. Mr. Agarwalji you can reply, you understood my question.

Sohan Lal Agarwal: I think, Sushilji, what you have mentioned about the FTA and Europe relationship. I also predict that Europe will be a big market in coming time because the installations which took in the year 2004-2005-2006 those plants can be replaced. Because they already have the land, they already have the structure and they already have the cable. So all the infrastructures are already there. They have to just throw away the old modules and put a new ones. But the market will come now because the FTA has recently been signed so we have to just see how it works out, because the Chinese have been dumping the European market but now the China realized that they were dumping at a loss because they were working on a price which was not economical and they have seen that if it is not economical and if they don't make profit then they don't plough back the money to reinvest into their projects. So I think in short time it should happen that with the increased capacity in India also the price will be economical where we will be able to fight back with the Chinese prices and we can try to get the European market. US market we cannot predict so long Mr. President is there we don't know.

Moderator: Thank you, sir, for answering that question We will move on to the next question which is from the line of Ankush Agrawal from Surge Capital Please go ahead.

Ankush Agrawal: Thank you for taking my question. So the first question is, if I look at our capacity utilization both for say the earlier cell line and the current new cell line and even the module line versus the Q1 which was the last peak for us, it is like 60%-70% higher. But still our revenues have only grown by 20% versus Q1 of FY26 so I am trying to understand what is happening over here has the realization reduced substantially over the last 6 months?

Websol Energy System Limited

January 30, 2026

Page 14 of 21

Sanjana Khaitan: So basically, of course, for the 2 cell lines that we have, both have increased in terms of utilization and module has doubled in terms of utilization. But as we mentioned somehow last quarter because of liquidity constraints at the customer end, offtake has been deferred. We still have such orders with us, but the offtake has been postponed. Owing to this, higher utilization of the lines has not translated into revenue. We are hopeful that this quarter would help normalize this situation.

Ankush Agrawal: Okay, like I think post Q2 results, the management sort of put a number of Rs. 500 crores-600 crores of revenue potential with the new cell line. So do we still believe that we can do that Rs. 500 crores-600 crores of revenues in the coming quarter?

Sanjana Khaitan: We would not want to give any guidance on the revenue part of it. You will appreciate it is a very dynamic industry wherein the final cells price is being driven by a lot of factors. So it is difficult to comment on any particular number but at a management level our focus is to ensure that we are utilizing all our cell lines to the maximum capacity possible and I think we have reported substantial progress on this front. Our target for the current quarter is to ramp up Line

-

2 to 90% up and module to 75%. We are hoping that will translate to healthy revenues as well.

Ankush Agrawal: Okay, last question on the gross margins, so in last quarters we were doing like high 60s sort of gross margins that has reduced considerably this quarter. You sort of indicated that part of it is also because the improving mix of modules wherein the gross margins are lower, but is that is what entirely explains the reduction in gross margins or there is something more to it?

Sanjana Khaitan: Correct. I would attribute it to potentially two factors. One of course as we mentioned earlier on the call, there has been some softening of cell and module prices, which has reflected in the margins. Second, initially we were just manufacturing and selling cells but in the previous quarter, you will see that our module has ramped up and we have increased the sales of modules. So given a blended margin basis, there has been some reduction on this front. So that is because of change in the product portfolio, I would say.

Ankush Agrawal: Okay, got it, that was helpful, thank you.

Moderator: Thank you, The next question is from the line of Rudransh Kalra from MB Investment. Please go ahead.

Rudransh Kalra: Hi, good evening. My question is why have the operating profit margins been subdued and what is the future impact of the subdued module prices in the upcoming quarters?

Sanjana Khaitan: Right. Margin has dipped a bit, because of the softening of the cell and module prices and, because of change in the product portfolio, wherein module is also a part of the product mix. I think most of us here know that the margins in case of module is different from the margins in case of cell, wherein, module margins are much lower. This has resulted in an impact at a gross margin level. There is some sort of reduction. And sorry, what was your second question? If you could please repeat?

Websol Energy System Limited

January 30, 2026

Page 15 of 21

Rudransh Kalra: What is going to be the future impact of the, we have seen pressure on the module prices and you have just mentioned that you have moved towards more of cell manufacturing to more of finished module, so what is going to be the impact of the pricing pressure that we have seen in the module prices in the upcoming quarters?

Sanjana Khaitan: Yes, so I mean we haven't moved to module in the sense that we are still operating 600 MW cells which we are selling in the market. Remaining 600 MW we are converting into our own modules and selling as DCR modules. With respect to your question on pricing, what our study tells us is that the price tends to be a bit dynamic. Definitely, it did come down last quarter because of which we have seen the impact at a margin level, but already we are seeing an increase in price in the current quarter. We don't foresee major variations in time to come.

Margins in the short term should revolve around the current levels only.

Rudransh Kalra: Alright, thank you so much. That answers my question.

Moderator: Thank you. The next question is from the line of Rahul Hemani from Hemani Financial Services. Please go ahead.

Rahul Hemani: Hello, everyone. So thank you for this opportunity. I think my answer has been questioned, but again I will frame it in a different manner. Most of the cells that we are manufacturing is into the DCR market. Now the cell prices have actually not fallen is what I understand in the DCR market and if that is the scenario then why have the Q3 figures for the revenue been so low? That is question number one. And question number two is that, starting June 2026, ALMM and for cell is also coming, so what will be the impact on the cell prices?

Sanjana Khaitan: Correct, so for the first question, last quarter which is Q3, prices did dip a bit. Now the prices have started rising again. So that has attributed to a little drop in margin and with respect to your second question on the ALMM p

art our first line is already covered under ALMM and our second line will also receive the ALMM approval by the next month. So I mean obviously once this mandate is out there, the demand for DCR will increase even further than what it is today. So it gives us more sort of scope and on a pricing stand again I would say that that would depend on how many capacities are actually live by that time because the moment the government starts mandating projects to use DCR cells, it depends on what is the visible supply at that point of time. So obviously these projects have a long gestation period and it is not very easy to bring such projects live in a very short period of time. So definitely in the short term the prices would remain at the level that they are and the margins would also be very decent at what level they are today.

Rahul Hemani: And you have been saying that the prices are now again inching up as it used to be in the first or the second quarter, is that?

Sanjana Khaitan: Correct. It have started moving up again.

Websol Energy System Limited

January 30, 2026

Page 16 of 21

Moderator: Thank you so much. We will take the next question from the line of Aman Soni from Nvest Analytics Advisory LLP. Please go ahead.

Aman Soni: Hi, thanks for the follow-up. Just wanted to understand on the pledge part. Are we going to take steps to reduce the pledge going ahead or what is our thought process in this regard?

Sanjana Khaitan: Yes. We are already in touch with IREDA for this purpose. As I said, current outstanding net debt is around Rs. 100 crores. All the shares which are pledged, rather, greater than 90% of the shares pledged, is towards the IREDA loan. We are actively working on releasing this share pledge in the next couple of months.

Aman Soni: Yes because I am asking this like I am seeing you are trying to improve the corporate governance doing the concalls and all and I hope we will be continuing that going ahead. So at the same time we should also be focusing on reducing the pledge and all right? You are speaking about the capex getting funded via internal accruals then why we are not working for reducing the pledge. So I hope we will be doing that, right?

Sanjana Khaitan: Yes, of course. We are already working on this and are hopeful that the release would come

soon. For the next loan which we will be taking for our expansion project in our wholly owned subsidiary, we are having conversations in line to ensure that there is no further pledge.

Aman Soni: Understood and one more thing, in your annual report, there is some contingent liabilities in relation to the income tax concern around Rs. 75 Cr. So what is our take on that particular amount of contingent liabilities?

Amrit Daga: Yes. We have already received the order from the commission of income tax appeal on 22nd December 2025 and they have allowed our claim in the income tax appeal. So this contingent liability as of now stands reversed and we have implemented the same procedures.

Aman Soni: It is a sign of communication to the exchange, isn't it?

Amrit Daga: Yes, we have communicated to the exchange on 22nd December.

Aman Soni: Understood.

Moderator: Thank you. The next question is from the line of Apoorv Singh from Panchratna Investors. Please go ahead.

Apoorv Singh: Thank you for the opportunity. It was a long wait. Congrats. I have been tracking this company from Rs. 250 crore market cap and today we are almost about to reach an annual PAT of Rs. 250 crore. It's a wonderful journey. All of you should be immensely proud. Thanks a lot for this journey. Before my questions I wanted to first publicly thank you for the wonderful turnaround. I have couple of questions. First question is on cost of capital and the return on the invested capital which you are seeing for the upcoming Rs. 3,500 crore capex. Second is on the Redington Websol Energy System Limited
January 30, 2026

Page 17 of 21
partner

ship of solar kits. Want to understand what is the significance of that partnership in terms of scheme of these things? Yes, these two questions, please.

Amrit Daga: Hi Apoorv, so the cost of funds depends on the lenders, how the lenders would like to give funds and at what cost. You must be aware that the Company is already rated at BBB+, so we believe that we will be able to raise the funds at rate that is prevailing in the market. Cost of fund should be as per current prevailing interest rate.

Apoorv Singh: Any range of cost of capital you can give us?

Amrit Daga: Generally, I believe the cost of fund as of now is between 9%-10.5%.

Apoorv Singh: Okay. And what are the kind of return on the capital we are expecting on a blended levels for two to three years?

Amrit Daga: As you see in the presentation, we have declared that our current ROCE is 51%.

Apoorv Singh: Because both of these capex will come live in the next let's say three years. So obviously dynamics will change but the cost has to be incurred right now and progressively, in fact. So wanted to understand what kind of return on the invested capital you guys are kind of comfortable with?

Amrit Daga: So we have already told you in the call that we expect some moderation in margins as the industry matures and become a larger industry. But to comment on what exactly will be the margin after two years is very difficult. However, we believe that the margins will be stable margin and healthy.

Apoorv Singh: So you don't see any stretch on the balance sheet because of the debt kind of we will incur?

Amrit Daga: Yes, as of now we don't see any stress on the balance sheet.

Apoorv Singh: Got it. Please on the Redington, if you can?

Amrit Daga: So the Redington is an operational deal that we continue to do with the middle clients. Redington is a known party, and we supply them the module as and when it's required by them.

Apoorv Singh: The Redington partnership, does that improve our distribution and help us in getting better margins? Wanted to understand how does this fall in the scheme of things in the partnership?

Sanjana Khaitan: It's a simple buy and sale arrangement. Like all our other buyers who buy modules from us, I mean there is no substantial change in margin on account of selling to Redington specifically.

Our market price for modules is pretty similar for most of the buyers. So there is no sort of difference in selling to them.

Websol Energy System Limited
January 30, 2026

Page 18 of 21

Apoorv Singh: Got it. Thank you.

Moderator: Thank you. The next question is from the line of Ashwani Agarwal from CASA Capital. Please go ahead.

Ashwani Agarwal: I just wanted to know about the current demand scenario like the market believes that the capital projects are currently seeing a bit less of demand, so is it getting offset from all the solar rooftops or the PM KUSUM demand and everything like is the major chunk of our sale is right now happening towards that area or is it still towards the captive projects?

Sanjana Khaitan: Yes. Currently, we are doing Mono PERC technology primarily and most of our products are

going for PM KUSUM and PM Surya Ghar schemes. We haven't seen any shift in demand. In fact, given that there is such a huge gap between the cell supply and module supply in the industry right now that for cells we are still being able to hold the ground very comfortably. Given we have our own module line, we are definitely able to have that advantage of being able to give the DCR module directly to such schemes.

Moderator: Thank you. The next question is from the line of Darshan Garg from Tiger Asset. Please go ahead.

Darshan Garg: Good evening. So what is the capacity utilization of the new expansion of 600 MW?

Sanjana Khaitan: For Line-2, we have recorded around 54% utilization in the previous quarter. The line was commissioned on 27th September 2025. The 54% reflects on the first 3 months since

commissioning.

Of course, we are ramping up these levels and as Ms. Vasanthi said, as we are speaking right now, for Line-2 we are already achieving utilization close to 90%. And as disclosed even in our earnings presentation, Line-1 we are operating at 97%.

Darshan Garg: Great. Secondly, like you have mentioned about the demand. So are we seeing the government offtake and government slowdown in demand?

Sanjana Khaitan: The latest numbers which I read were 24 GW of ALMM approved cell capacity 145 GW of modules capacity. I don't really see any sort of issue in terms of the demand. There is sizable demand for solar cells and as I mentioned having the advantage of our own module line gives us access to sell the final product directly to such schemes. So we aren't very wary on the demand front and we have a very positive outlook in terms of the future roadmap.

Darshan Garg: So ma'am, the PPA for the renewal project has slowed down. So would that really affect the demand?

Sanjana Khaitan: We haven't seen any impact on that front given that we are catering primarily for the pumps and solar kits for residential purpose. So given our book, we haven't seen much change in demand from our end consumer.

Websol Energy System Limited
January 30, 2026

Page 19 of 21

Darshan Garg: Okay ma'am. Thank you so much

Moderator: Thank you The next question is from the line of Deepak Rao from Qber Asset Advisors. Please go ahead.

Deepak Rao: So Sohan Lalji and team congratulations on excellent results and thank you for holding the maiden analyst call. I have three questions to understand your company better; on sourcing, technology and demand. Demand has been sort of answered already As far as sourcing is concerned I'd like to know like the sourcing of wafers at this point of time, which are the countries you get it from? Do you see any challenges? And as you said China has been dumping wafers, do you expect cost to go up in wafers?

Sanjana Khaitan: Right now we are securing wafers only from China. As you would know there is no such installed capacity in our country for wafers. So definitely, there has been some increase in price on account of wafer, but it hasn't been substantially high. In terms of risk, personally I do not foresee any risk for procurement of this raw material from China. All the manufacturers in India currently are doing the same and I would think China's economy is also supported greatly by the exports they are making of these wafers given that there are such large over capacities in China that maybe they are not able to absorb this capacity at their own end. Hence, I do not see any risk in terms of procurement. Definitely price is dynamic. But as of now given the comfortable margins, I would not foresee it as a risk. Having said that, we have also taken the initiative to backward integrate and install our own ingot and wafer manufacturing capacity. We are diligently working on this and we are hopeful that once such capacity is on ground, there would be greater synergies.

Deepak Rao: Thank you very much. I think there was another person who asked about Linton, but he could not get answered. Do you have plans on when the wafer and ingot manufacturing will take place?

My last question was on technology, so what are the plans? Are you going to replicate the technology that you had in West Bengal and Andhra Pradesh? Are you going to get equipment from Europe like you have done before? Are you going to be reliant on China for all this? Do you see any challenges in terms of setting up the plant there?

Sanjana Khaitan: Correct. So on your first question with respect to Linton, we have signed an MOU for the partnership with them and currently we are working on all the technical details for this project, in terms of building of team and all the training exercises that need to take place given that it is a new technology for our country. We are working on this and we are hopi

ng that we will be

able to bring such capacities in time of the Government's ALMM mandate for wafer which has been announced for June 2028. To begin with, we have planned a 2.5 GW line which we will further expand in time to come. That is on the wafer front. With respect to your question on the

technology in Andhra Pradesh, so currently in West Bengal our 1.2 gigawatt GW is completely Mono PERC. So of course in Andhra Pradesh we will be migrating to the Topcon which has higher efficiency levels. For the same currently we are evaluating both German equipment as well as Chinese equipment. We will be placing orders for the same close to April and until then we are continuing with our evaluation in order to choose the provider which is able to guarantee

WebSol Energy System Limited
January 30, 2026

Page 20 of 21

maximum efficiency of the product. So right now we are keeping both our options open until the time of ordering.

Deepak Rao: Thank you very much.

Sanjana Khaitan: Thank you so much.

Moderator: Ladies and Gentlemen, we will take the last question for today which is from the line of Yash Chandalia from British Asian Trust. Please go ahead.

Yash Chandalia: Hi everyone. Firstly huge congratulations to the entire team, amazing set of numbers. I had a question on the existing cell line, correct me if I am wrong but from what I understand the existing line can be upgraded to Topcon if we choose to do that. So I wanted to understand if there is any visibility on that or any plans to upgrade the technology to Topcon?

Sanjana Khaitan: Correct. We are evaluating this already given that in time to come the industry is going to transition from Mono PERC to Topcon. We have been evaluating converting our current Mono PERC facility to a Topcon facility. We do not have an indicative timeline right now with respect to when we will be doing this given that we have a strong order book for Mono PERC and as we mentioned, there is a strong demand from PM KUSUM and PM Surya Ghar for Mono PERC modules. But definitely, we will be converting our line in time to come. We will be able to share further details once we have the entire cost and timeline of the same. We are aggressively working on this.

Yash Chandalia: That's very encouraging to hear. Another question I had was, so the investor presentation mentioned that they are evaluating ancillary opportunities within their entire sector. So we obviously know about the backward integration that you are planning, but just wanted to get a sense of any other opportunities that you are potentially looking at in this space and if you could give us some indication if there is anything?

Sanjana Khaitan: So I mean as of now our strategy is to scale up cell and module manufacturing which we are doing by means of the greenfield project in Andhra Pradesh and along with that we have proposed to backward integrate into wafer and ingot. This is what is firm and we are aggressively working on the same. Meanwhile, of course, we are working on smaller projects for example, reduction of silver consumption in our products and researching on technologies post Topcon, like Back-Contact and Perovskites. So we are already researching on all of this but in terms of diversification to new businesses as of now we haven't really, I mean we are exploring in terms of identifying these opportunities, but as of now we do not have any firm plans of any diversification at the moment.

Yash Chandalia: Got it. Final question, so what I see is that the inventory for this quarter has actually gone up, right? So when there is such a huge order book already in line like I think Rs. 1,150 crores, why is it that the inventory has built up to Rs. 93 crores?

WebSol Energy System Limited
January 30, 2026

Page 21 of 21

Sanjana Khaitan: As I said that, I mean, the reason the inventory has built up is because of certain liquidity constraints at the customer end. In fact, this has been

been an industry phenomenon that there has been some temporary liquidity constraints. This has delayed the sales. Of course, these orders are not cancelled, but just deferred orders. We are hopeful that the slow offtake of the previous quarter will get neutralized in the current quarter. Order book still remains strong and whatever numbers we have shown, we are extremely confident about that. But definitely Q-o-Q there is some change in offtake because of certain constraints at the end user front.

Yash Chandalia: Got it. Thank you so much. I think this has been extremely helpful. Great, congratulations again.

Sanjana Khaitan: Thank you so much.

Moderator: As that was the last question for today I now hand the conference over to Ms. Sanjana for closing comments. Thank you and over to you, ma'am.

Sanjana Khaitan: Thank you so much everyone for joining the call. It was great interacting with you all and we will make sure that we do these investor calls every quarter. Such that we can stay more connected. Thank you so much.

Moderator: Thank you, ma'am. Thank you members of the management. On behalf of WebSol Energy System Limited, that concludes this conference. We thank you for joining us and you may now disconnect your lines. Thank you.

Q4 & FY26 Earnings Conference Call"
April 28, 2026

MANAGEMENT : MR. SOHAN LAL AGARWAL – MANAGING DIRECTOR
M S. SANJANA KHAITAN – EXECUTIVE DIRECTOR
M R. AMRIT DAGA – CHIEF FINANCIAL OFFICER
M S. SREERAM VASANTHI – CHIEF TECHNICAL OFFICER

Websol Energy System Limited
April 28, 2026

Page 2 of 22

Moderator: Ladies and gentlemen, good day and welcome to the Websol Energy System Limited Q4 and FY26 Earnings Conference call. As a reminder, all participants line will be in the listen-only

mode and there will be an opportunity for you to ask questions after the presentation concludes. Should you need assistance during the conference call, please signal an operator by pressing star then zero on your touchtone phone. Please note that this conference is being recorded. I now hand the conference over to Mr. Sohan Lal Agarwal, Managing Director. Thank you and over to you, sir.

Sohan Lal Agarwal: Thank you very much. Good afternoon everyone and thank you all for joining us today. FY26 has been a landmark year for Websol. If I take a step back and look at this year as a whole, I would say it was a year where the work of the last few years really started showing up, both in our operations and in numbers.

Reflecting the strong performance of the year and our confidence in the business, the Board has recommended a dividend of INR 0.25 per share for FY26, subject to shareholder approval.

Moving on to the operational updates during the year, we commissioned cell line 2 in September 2025, which has taken our cell capacity from 600 MW to nearly 1.2 GW, practically doubled. And this was done within our planned timeline and entirely through internal accruals. We have not raised any funds for Phase 2. That matters to us because in this business, it is not only about expansion; it is also about how disciplined you are with your capital. In terms of what comes next, our growth ambitions remain very much intact.

We are upgrading one of our existing Mono PERC cell lines to TOPCon technology. This will take our total cell capacity from 1.2 GW to 1.35 GW and more importantly, it positions us at the higher end of the efficiency curve. We are targeting cell efficiency of more than 24.5% on this upgraded line.

We see this as an important milestone in itself and also as a stepping stone towards our planned integrated 4 GW cell and module facility. Our capex and growth plan remain on track. On Andhra Pradesh, we are evaluating the next steps and we will share more details in time to come. What we have done is to apply greater discipline in sequencing, in funding structure and execution planning before we commit to firm timelines. In a project of this size, we believe clarity is better than an early announcement. The solar sector today is in a very significant opportunity cycle.

We recognize that this is the time to act thoughtfully, but proactively and I want to assure all of you that the management shares that urgency. For us, growth is a combination of additional capacity, full run-rate utilization of existing assets, productivity gains, technology progression, backward integration and better cash conversion.

All of these are very active areas of focus for us. Our backward integration work is also progressing nicely. The work with Linton on the ingot and wafer feasibility is part of strengthening our position across the full value chain. In this sector, agility matters and we are very conscious of that.

Websol Energy System Limited

April 28, 2026

Page 3 of 22

If I look at where Websol stands today, the business is stronger operationally, financially and strategically than where it was a year ago, we have doubled our cell capacity. We have improved utilization meaningfully across all lines. We have delivered the highest revenue, the highest EBITDA and the highest PAT in the company's history. We have generated strong operating cash flows.

Our balance sheet is the strongest it has been in our 30-year journey. Most importantly, we have created the opportunity for the next leg of growth. That, in our view is not a company standing still; that is a company preparing carefully for what comes next. We remain confident about t

he

opportunity ahead and we remain committed to building this business with discipline, ambition, and responsibility. With this, gentlemen, I would now like to request Sanjana Khaitan to take you through the operational and financial performance for the year in more detail. Thank you very much again.

Sanjana Khaitan: Thank you, sir, and good afternoon everyone. Let me take you through our operational and financial performance for Q4FY26 and full year FY26. Starting with the full year, revenue from operations stood at INR 1,049 crores a growth of nearly 82% over last year. EBITDA came in at INR 429 crores a growth of around 70% with an EBITDA margin of 41%.

PAT was INR 303 crores, 96% higher than last year, translating to a PAT margin of 28.6%. This has definitely been a record revenue for Websol. For Q4FY26, revenue was INR 401 crores, EBITDA stood at INR 146 crores and PAT was INR 125 crores. Q4 has been the best ever quarter for the company on practically every parameter.

Revenue grew 132% YoY and 54% sequentially. EBITDA grew 86% YoY and PAT was up 158% YoY. Moving on to cash flow and the balance sheet, during the year we generated INR 255 crores of cash from operations, which is roughly 84% of our PAT. As a result, the company turned net cash surplus, highlighting strong financial discipline.

Net worth has more than doubled from INR 278 crores to INR 631 crores. Debt to equity has come down from 0.55 times to 0.19 times. Our return ratios have also strengthened meaningfully with ROCE at 66% and ROE at 67%. Reflecting this overall improvement, during the year CRISIL has assigned us a BBB Plus stable rating, which is a strong endorsement of the progress made.

On the operational side, cell utilization remained high at above 90% for cell and module line achieved its highest ever monthly utilization at 80%. For Q4 as a whole, our combined cell capacity utilization stood at 90%. As we move into the coming quarter, we expect to approach full run-rate utilization across all our lines.

On the order book front, we closed Q4FY26 with a confirmed order book of INR 1,161 crores with cells contributing around 40% and modules contributing 60%. Our book-to-bill ratio stood at 1.02x for the quarter, providing healthy visibility into the next few quarters of operations. Overall, FY26 has demonstrated the kind of operating leverage and cash generation our existing capacity is capable of delivering and gives us a strong base to build on as we move into the next phase of growth. With this, we can now open the floor for questions. Thank you very much.

Websol Energy System Limited

April 28, 2026

Page 4 of 22

Moderator: Thank you very much. We will now begin the question-and-answer session. The first question is from the line of Amit Mishra as an Individual Investor. Thank you and please go ahead.

Amit Mishra: Yes. Hi everyone, good afternoon. Congratulations on fantastic Q4 and FY26. As management has already elaborated, it is sort of a turnaround year for the company. So, the presentations and press release is with us, so thanks for all that detailed information. I just wanted to run on one particular subject that is the pledge we are carrying for IREDA and what sort of timeframe we have to address it, now that we are like net cash surplus company. So, if you can just like highlight what is the timeframe for this?

Sanjana Khaitan: Yes, sure. So, the outstanding net debt under the IREDA facility is at approximately INR 92 crores and, of course, we appreciate that more than 80% of the promoter shares are pledged on this account. So, as you correctly mentioned, we have turned net cash surplus as of March 31, 2026.

And we are currently in advanced discussions with IREDA for repayment of the loan and release of the pledged shares. Of course, there is a process involved which includes certain standard procedural steps and I would like to say that we are on track to complete the repayment

and get

the requisite shares released. So, hopefully in the next month or two, we should be able to get this job done.

Amit Mishra: Right, because we would be preparing for next capex expansion and can you let us know what is the plan for debt? Is it going to be immediately taken once you start the project or would it be sometime after?

Sanjana Khaitan: So, we have definitely started on the project and as we have a comfortable cash surplus with us, currently we are making do of all the expenses through this. At some point of time, definitely we would have to raise some amount of debt, but the idea is to use our current surplus to get down the debt component as much as possible.

Amit Mishra: Right, okay. And can you give us the timeline for the TOPCon upgrade for the line, one of the Mono PERC lines?

Sanjana Khaitan: We have already started on this project and it seems that by February 2027, which is less than one year from today, we will be able to upgrade the line and start commercial production.

Amit Mishra: So, this would impede production of one line in some way or form? Can you let us know how long would that period be? I mean, how long it takes to integrate the new equipment to the Mono PERC existing line?

Sanjana Khaitan: Yes, so I think Vasanthi ji can take up that question with respect to what the process is.

Sreeram Vasanthi: By February 2027, we would be starting TOPCon, so converting the PERC to TOPCon. And it would take around 2 months to come to full capacity level, but slowly we will start off with small capacities because we need to change the process steps to integrate it. And then, a lot of trials will be there of course, but it will not take more than 2 months to come to the full capacity.

That is what we are expecting.

Websol Energy System Limited

April 28, 2026

Page 5 of 22

Amit Mishra: Okay, understood. That would be closer to February 2027, that is just the plan?

Sanjana Khaitan: Yes, February 2027 is when we are expecting to record commercial start. And after commercial start, what Ms. Vasanthi is mentioning is that we are factoring around 2 months to be able to

ramp up at optimum utilization levels. Because once we even record commercial start, obviously the product becomes saleable, but it takes time to reach that high utilization level. So, that would potentially take 2 months as per our current planning. But definitely we will be able to bring the product to the market in February 27.

Amit Mishra: Perfect. And just last one, on the Phase 3 capex for 2 GW, what is the update right now? Where we are in terms of land acquisition and start of construction, if you can reflect on that as well?

Sanjana Khaitan: Yes, with respect to the 2 GW project also, our capex commitment and growth roadmap is definitely on track. What we are doing right now is we are evaluating what is best for the company, the right sequencing, the right funding structure and the right execution approach for a project of this scale. So, once we have like a little more detail on that, we will definitely come back with the necessary communication.

Amit Mishra: Okay, thanks. I will join back in the queue.

Sanjana Khaitan: Yes, thank you.

Moderator: Thank you. The next question is from the line of Naman Jain from Kotak Institutional Equities. Please go ahead.

Naman Jain: Yes, a few questions here. One is on the upgrade for like 600 MW that you are going to convert to 750 MW of TOPCon. What will be the cost and the period? About 10 months is I am guessing what you will take doing it gradually. How much of the production will be impacted?

And another point was that we have seen in other companies that what they tend to do is they are scrapping their PERC line and building up a new TOPCon line. So, why has that been the case for them and we are upgrading this line directly? If you can clarify this and then I will come up with other questions?

Amrit Daga: Yes, hi Naman, Amrit this

side. We are expecting as of now that it will cost around INR 250 to INR 270 crores for this upgrade. And it is not that we are scrapping our old line; actually we are adding more equipment to that line so that we can convert our existing Mono PERC line to TOPCon line. So as of now we estimate that roughly half a month there could be some issues with the production as we integrate these lines to TOPCon.

Naman Jain: Okay, but the other time you can work at 100% at the current levels, if I am not wrong?

Amrit Daga: Yes.

Naman Jain: Okay, got it. And another thing is that in this line, will you also be able to produce G12R, the larger cell or will you be producing the older M10 using the M10 wafer?

Amrit Daga: Yes, we can produce G12R, that is 210 by 182.

Websol Energy System Limited

April 28, 2026

Page 6 of 22

Naman Jain: Correct, okay. Got it. Another thing which has come up is that while C&I has seen very strong demand, some of the IPPs are saying that they are delaying capacity expansion due to lack of evacuation or the transmission capability capacity. So, are you seeing some weakness from that segment? If you can just give your thoughts on KUSUM, Rooftop, C&I and IPP, that will be very helpful from a demand perspective?

Amrit Daga: Yes, as of now our focus is on DCR market. So we are largely concentrating on PM-KUSUM and PM Surya Ghar. And we are not facing any demand-related issues as of now.

Naman Jain: Got it, understood. And just one final question. What have been the pricing trends on the cell, DCR cell and DCR module business over the last 6 months, 8 months, if you can share? Because some of the capacities have come up, however, the demand has also gone up. So, if you can just share a few thoughts on that?

Amrit Daga: In line with what we have shared on the previous call, the cell realization is around 13 to 13.5 cents per watt and the module realization is around 22 to 22.5 cents per watt peak. So, there has been some softening in the price.

Naman Jain: Got it. But this is despite the increase in silver prices, is it?

Amrit Daga: Yes, correct.

Naman Jain: Okay, got it. Thank you. That is all from my side. Thanks a lot.

Moderator: Thank you. The next question is from the line of Yash Jain from Dam Capital Advisors. Please go ahead.

Yash Jain: Yes, so good afternoon. Firstly, congratulations on a good set of numbers. So, I have two quick questions. First is what is the execution timeline of your current INR 1,160 crores order book?

And second is like given the current cost environment and spot pricing trends, how are margins shaping up for non-DCR and DCR modules? Yes, that are my two questions?

Sanjana Khaitan: Yes, with respect to our order book, so as per the last quarter, order book stood at somewhere close to INR 1,150 crores, which after a INR 401 crores of sale, we are now standing at INR 1,161 crores as of last quarter, which translates to increase in confirmed orders of INR 412 crores. So, if you look at our last quarter revenue numbers, that includes a 1.2 GW cell capacity and a 550 MW module capacity. Somewhere this INR 1,161 crores is something which we feel

confident that we can complete in one financial year.

Yash Jain: Okay. And the second question?

Sanjana Khaitan: Yes, and with respect to margin, definitely over the next 2 years, 3 years, we expect cell margins to remain healthy. Obviously, there will be some variability, like for example, recently we have seen how silver price increase has hit margins and obviously some softening has come on account of the final sale price also.

However, with ALMM List 2, which is expected to become mandatory and continued demand from schemes like PM-KUSUM and PM Surya Ghar, the demand environment remains

Websol Energy System Limited

April 28, 2026

Page 7 of 22

supportive. So, definitely it will be interesting to see how the margins evolve, but it should hopefully be in the same vicinity

with some variability.

Yash Jain: And it's for non-DCR modules?

Sanjana Khaitan: Non-DCR is not really a focus area for us because as we have a 1.2 GW cell line, 600 MW of cells we absorb into our module line and we sell the final DCR module. So, currently our order book does not include any non-DCR. And as you must have gone through the notification by the government of the June 2026 wherein DCR has got mandated for most projects, we are more or less compliant with that because we don't have a non-DCR book.

Yash Jain: Okay, clear. Thank you.

Moderator: Thank you. The next question is from the line of Abhi Sehgal from Singularity AMC. Please go ahead.

Abhi Sehgal: Hello, congratulations sir on a great set of numbers. So, just one question from my end. So, we see that the EBITDA margin has reduced over the year across quarter by quarter. Just wanted to understand, is this because of an additional production of modules or any other particular reason for this?

Sanjana Khaitan: Yes, you are absolutely right. Module margins are structurally lower than cell margins and definitely as in Q4 we've reported our highest ever module sales, the overall EBITDA has been impacted because of that. So, on a cell level specifically, as I previously mentioned, because of increase in silver cost and softening of the final sale price. Some amount of EBITDA compression has taken place, but definitely the drop is majorly on account of module being introduced in our product mix and contributing to our revenue more than the cell number.

Sanjana Khaitan: Although one other thing I would like to point out that despite the moderation in margins, EBITDA has grown 86% YoY and around 37% QoQ, which reflects the strong underlying scale-up in the business.

Abhi Sehgal: Yes, ma'am. Congratulations once again, ma'am. Thank you.

Moderator: Thank you. The next question is from the line of Maitri from Sapphire Capital. Please go ahead.

Maitri: Yes, firstly in the previous call you mentioned that there were certain inventory build-ups and liquidity constraints from your consumers and your clients. So, has that easing happened in the Q4 or are you seeing that happening in Q1?

Sanjana Khaitan: Yes, definitely there was some delay in off-take last quarter which as we mentioned was an industry-wide phenomenon driven by temporary liquidity stress at the customer end rather than order cancellation. However, now these deferred orders have been executed and Q4 off-take reflects this recovery. In addition, we have secured new orders of INR 412 crores as I just mentioned and it takes our order book to a strong INR 1,161 crores as of now.

Maitri: That is great. And currently, what sort of bid pipeline do we have? Do we kind of give a number on the cells order that we are bidding for, the module orders we are bidding for?

Websol Energy System Limited

April 28, 2026

Page 8 of 22

Sanjana Khaitan: Yes, the mix as I think we put it in our investor presentation also, it's around 60% of this order book is module and 40% is cell.

Maitri: Not the order book, I am asking about the bid pipeline. Any new orders that you are bidding for that we might win in FY27?

Sanjana Khaitan: Understood. Typically, right now as our order book is Mono PERC, we are not involved in any tendering. So, most of the orders that we are achieving are basically either through module manufacturers in case of cell and in case of modules, it's basically these solar pump players predominantly, who are then tendering ahead. So, for us, our final consumer segment is them. So, we do not actually directly tender for any government orders as of now.

Maitri: Okay. And going forward now that you mentioned that the module margins are structurally lower than the cell and we're adding like more capacity in the module as well because we're adding I

think up to 4 GW of capacity in the module side. What sort of split do you expect the company to have in module or cell

manufacturing in like maybe 2 to 3 years once the Andhra Pradesh facility is live?

Sanjana Khaitan: Yes, so I mean, definitely right now we have one extra cell line compared to the module line and whatever capacities we are going to bring ahead, we are planning to bring integrated capacities of cell and module in a phased manner of 2 GW and then 2 GW. So, this extra cell line that we currently have of 600 MW which is getting upgraded to 750 MW owing to the TOPCon expansion, that will always be an additive. So, that will be the extra cell supply which we'll have.

Maitri: Okay. And the module manufacturing that we have, the 550 MW that's on the Mono PERC side, right? Are there any plans to kind of upgrade that as well to the TOPCon side?

Sreeram Vasanthi: Yes, it will be like some kits will be changed, some operating part of the equipment has to be modified, but that's not really a big upgrade. So, that can easily be managed.

Sanjana Khaitan: Yes, from a capex perspective also, that's much on the lower side and it's definitely a fairly quicker thing to do. So, basis how orders shape up for us in the future, we always have the access of doing that.

Maitri: Okay, that's great. And just one last question, if you can kind of give me the quantitative numbers of what sort of margins we have on the modules and what margins do we have on the cell?

Because I think you mentioned the realizations on them, but if the EBITDA margin is possible to give on both of them?

Amrit Daga: We do not report the margins separately. We do report the margin on consolidated basis because we are using our own cell to make modules. Obviously as you are aware that the module margins are lower in comparison of solar cell.

Maitri: Okay. So, any sort of guidance you would give on the way the margins will kind of shape out to be in FY27 with like increasing production from the module?

Websol Energy System Limited

April 28, 2026

Page 9 of 22

Amrit Daga: Madam, it's a very dynamic market. It's very difficult to predict how the margins will sustain in the future. But on the margin front, over next 2 years, 3 years, we expect the margin to remain healthy with some variability, with ALMM List 2 expected to become mandatory and continued demand from schemes like PM-KUSUM and PM Surya Ghar, the demand environment remains supportive. So, beyond that, margin will depend on how the supply side actually ramp up and stabilize.

Maitri: Okay. And on the Andhra Pradesh facility, you've said that you'll be mentioning the timelines post everything has been decided, but any sort of range you can give? Will it happen in the end of FY27 or maybe we are postponing it by a year? Any sort of range for the Andhra Pradesh facility is possible?

Sanjana Khaitan: Yes, there are no plans of postponing the expansion commitment. Definitely our best effort is to ensure that we are able to bring up the capacity as we've already promised. I think June 2027 is what we are targeting.

Maitri: Okay. Yes, that is it from my side. Thank you.

Moderator: Thank you. The next question comes from the line of Ashish Khurana from ANK Capital Limited. Please go ahead.

Ashish Khurana: Thank you. Firstly, congratulations to the whole team for a fantastic Q4 and FY26. My first question was on our the second tranche of the 2 GW capacity that is expected to come online around say mid-CY28, which is about 2 years away and it is on TOPCon. So, do we see any risk that the demand might shift meaningfully from TOPCon to some other newer technology like BC by then? And also by when do we need to lock in the technology choice from an equipment ordering or execution perspective in case we decide to shift midway from TOPCon to some other technology given the scenario at that time?

Sreeram Vasanthi: Yes, See TOPCon, people have just started putting TOPCon and that is not as easy as a PERC technology. So, that will take some time to stabilize. So, 1 year definitely TO

PCon will continue.

Everybody talks about Back Contact, but you know, the back contact only LONGi and Aiko to some extent have made, but we understand there are a lot of challenges that they are facing. Back contact is not really that mature a technology. It will take time, it will take at least 2 years' time for that to come fully into the market. But what in the meantime we are doing is whatever in the 2 GW that will be we will put up, we will keep space available.

I mean, spaces left for these for to adapt back contact as well, so that when that becomes mature, we will be able to insert these equipment in between and we will be able to run. Like the way we are upgrading PERC to TOPCon, we will be able to upgrade TOPCon to back contact as well. But it will take time. It's not going to be that quick. I mean, the way PERC moved quickly

to TOPCon, TOPCon won't move that quickly to back contact.
Ashish Khurana: Thank you, that was very clear.
Websol Energy System Limited
April 28, 2026

Page 10 of 22

Sreeram Vasanthi: We are keeping ourselves safe, so that even if that comes within say the next 2 years' timeline, we will be able to adopt that as well.

Sanjana Khaitan: Yes, and just one point I want to add to this that that is the reason why we've opted for a phased expansion so that we can de-risk ourselves of any technology change because we appreciate how dynamic this space is. As Ms. Vasanthi said that while our strategy is to keep provision for any technology update, we also want to upgrade in a phase-wise manner so that any sort of change in technology we are able to adapt very quickly.

Ashish Khurana: Understood, makes sense. Thank you. My second question was about your views on the depreciation period of our cells and module capacity. So, I think in Q4 we already re-assessed some of our assets and I think some of our peers are depreciating it at the TOPCon lines or Mono PERC lines in 3 years and 4 years. And so going forward, how should we see the economic life of these assets like, would you like come down from the stated policy of say 10 to 12 years in your annual report to a lower period on these?

Sanjana Khaitan: Yes, so we've already reduced the useful life for the new equipment which is the TOPCon to 8 years and for the Mono PERC we are maintaining it at 3 years. So, this is as per what our understanding of the technology landscape is. So, definitely from 12 we've brought down to these numbers. So, we'll see how things update in the next few quarters or years and if other revision is required, we will go ahead and do that.

Ashish Khurana: Noted. And in terms of the effective tax rate for FY27, so I think last year we had unutilized tax credits. So, are there any more credits and what would be the tax rate in this financial year?

Amrit Daga: Yes, as of now we have utilized all our tax credits. The next year's rate will be standard income tax rate that is applicable to all companies.

Ashish Khurana: Got it. And one final question. What percentage of our revenue directly or indirectly is dependent on the government like a rough figure?

Amrit Daga: We are not selling any product directly to the government. We are in the DCR line of business and the DCR cells and modules are used in the government projects driven by PM-KUSUM and PM Surya Ghar.

Ashish Khurana: Yes, so revenue dependency won't be there for those projects. Got it. Thank you so much for taking time to answer my questions.

Moderator: Thank you. The next question is from the line of Pratham Shah from Resurgence Capital. Please go ahead.

Pratham Shah: Hi, Yes, so speaking about your utilization level which was at 90% in the last quarter. So, when you are done upgrading it to the TOPCon facility, is your optimum utilization going to remain at 90% or what is the percentage you are planning to keep it at?

Sanjana Khaitan: Yes, right now in case of cell our utilization on a combined basis is over 90% and th

at we believe

is the highest which can be maintained. With respect to TOPCon, obviously our target would be

Websol Energy System Limited

April 28, 2026

Page 11 of 22

the same, but as Ms. Vasanthi said it will take approximately over 2 months to get to that level after commissioning. But of course, the target would remain the same that we have to go over 90%.

Pratham Shah: Right. And my second question is that speaking about your expansion plans, so what are your targets for captive use of cells and selling of cells to third party?

Sanjana Khaitan: Yes, of course, as we are getting integrated capacities on board like the June 2027 and June 2028 capacities, so the idea will be to sell the final module to the end customer. So, the only extra cells that we'll have access to is from our current operations of around 750 MW. So, that we will continue to sell to module manufacturers. Remaining all other cell capacity we will use captive into our own module line.

Pratham Shah: Right, okay. And we also know that there are some Chinese manufacturers of cells. So, what is the premium that we are getting compared to them?

Sanjana Khaitan: Yes, definitely for us our cost of manufacturing is different compared to Chinese suppliers, but obviously here whatever we are producing we are using locally for the DCR market. So, the market price is driven by the industry here rather than what the pricing is in China. So, definitely there is not much correlation to that.

Pratham Shah: Okay, thank you so much.

Moderator: Thank you. The next question is from the line of Sushil C. Choksey from Indus Equity Advisors. Please go ahead.

Sushil Choksey: Congratulations Sohan Lal ji and team Websol for excellent performance for the year gone by.

My first question is your current capacity of 1.2 GW of cell would ramp up in February to 1.35

GW. Now based on 90% utilization, I see a clear roadmap that your solar cells which you've

booked, there is a scope to increase that size to double for the year. Am I assuming right?

Sushil Choksey: Output right now you've booked for INR 466 crores which is roughly 450 to 475 MW, whereas

if you consume for your module manufacturing of 550 at 70%-80% utilization would be 500

MW or less than 500, 400 and some odd MW. So, your potential to sell cell in the domestic

market outside your module captive consumption should be in the region of 750 to 800 MW?

Sanjana Khaitan: Yes, because once it increases to TOPCon, so we'll get the advantage of that additional 150 MW.

Sushil Choksey: No, but Sanjana, that is after you achieve TOPCon in February. But as on today till you continue

Mono-PERC also, 1.2 GW you are running the plant at 90% efficiency. If you take at 11 months

itself, at 1,100 you'll consume for your module roughly around 400 MW. So, you can sell 700

MW of cell. Am I assuming right or wrong?

Sanjana Khaitan: Correct. Broadly correct.

Sushil Choksey: Yes, so your potential order book for the current year, the pipeline for order book is 1,161 has

potential to grow by 50% in near future, maybe in the quarter?

Websol Energy System Limited

April 28, 2026

Page 12 of 22

Sanjana Khaitan: Sir, definitely we are seeing more orders than the number we've reported, but as of now it stands at 1,161, but definitely there would be some appetite to cater to more.

Sushil Choksey: What's the update on the current KUSUM scheme which is likely to roll out, the new KUSUM 2?

Amrit Daga: So, sir, on the KUSUM 2 we need to check the scheme details, but I think the scheme is more favorable than the earlier scheme, but the exact detail we need to check out and then we can let you know.

Sushil Choksey: Is it that the scheme is going to be much larger than what it has already rolled out and it's like 30 GW?

Amrit Daga: So, sir, that's what I told you that we are hearing about this, the scheme is larger than the previous one. But the fine print of the scheme is still working out and

we will revert to you once we are aware of the entire benefits.

Sushil Choksey: Okay. The next question is SEZ policy some reforms have taken place. Do you estimate in the current year once the clarifications are achieved that we will have some benefit for the Falta plant?

Amrit Daga: So, sir, as of now what practice we are doing in SEZ, we will continue to follow that practice. We are more comfortable with the older scheme, sir.

Sushil Choksey: No, no, I am not able to understand possibly that does the company have additional benefit because of the SEZ policy which is being spoken from the budget?

Sanjana Khaitan: Yes, so the budget did mention about some waiver, but I don't think there has been any follow-up on that, so there's little clarity with respect to what the exact policy would be.

Sohan Lal Agarwal: The budget says that the SEZ units will be allowed to sell in the DTA market. But on what conditions has not yet been clarified. So, the notification is still awaited, once it will come then we'll be doing it.

Sushil Choksey: Sohan Lal ji, my next question is directly to you. Would you work to increase your holding pattern from where we stand today after the warrant conversion?

Sohan Lal Agarwal: We'll see. Let us wait for this. Right time we'll take the action.

Sushil Choksey: Next question to Vasanthi ma'am. How confident are we to achieve the TOPCon production integration within 15 days and ramp up in two months for Line-1 which you enabled with order of machinery as of today?

Sreeram Vasanthi: So, basically why we are saying that is when the new machinery comes, we have a separate area allocated for the new machinery which is just adjacent to the existing plant. So, there we are going to ramp up installation because commissioning & installation takes time. So that work will be done while the existing plant is continuing to run. Once that plant is ready, then we will open up the existing plant connection.

Websol Energy System Limited

April 28, 2026

Page 13 of 22

Sushil Choksey: Mono-PERC line?

Sreeram Vasanthi: Yes, and so we will save time. That's how we are planning, and ramp up, of course, we'll have

our equipment provider's integration support and our own in-house knowledge, we will be able to ramp up in 2 months' time. That is our thinking.

Sushil Choksey: So, based on our experience of this ramp up, if we are successful and we are able to achieve the capacity what is being visualized of increase of 20%, 600 going to 750, are we going to continue the second line on Mono-PERC or that also we'll look to convert to TOPCon?

Sreeram Vasanthi: That we will think later actually because, PERC is still being utilized and there are some advantages from the PERC, so we will continue to run that line. We will more focus on the new expansions.

Sushil Choksey: Vasanthi ma'am, Surya Ghar and the other the farm program and the module program for the solar roof, both has a greater demand for Mono-PERC cell compared to TOPCon, that is what is my understanding, right?

Sreeram Vasanthi: Right, right, yes.

Sushil Choksey: Yes, so that demand can continue till the government schemes are rolling out. Any update on ingot to wafer integration of technology understanding, manpower which was going to go for training or anything else?

Sreeram Vasanthi: Yes, so we have signed that MOU and we are in technical discussion as well as team building. So, the target is that by the deadline of June 2028 ALMM-III, we will be completely ready. So, we are in quite a good situation as far as the ingot and the wafering plant is. So, we have ourselves also done a lot of study, lot of discussion with the equipment supplier and I think we are in a good situation.

Sushil Choksey: Sohan Lal ji and Vasanthi ma'am, based on your technical expertise, we have increased the current facility from 100 MW to 600, 600 to 1.2 GW. Now you're likely to go to 1.35 and hopefully you will be at 1.5 when you

implement the second start. Based on the current utility and the space what we have, does Falta have any additional benefit of adding capacity on the existing land, building and utility?

Sreeram Vasanthi: No, further beyond this, I don't think it is possible.

Sanjana Khaitan: There is little scope of any further expansion potentially.

Sushil Choksey: Okay. And we will await your Andhra expansion details as and when you decide. Good luck for the year and best wishes to the entire team for the year.

Sanjana Khaitan: Thank you.

Moderator: Thank you. The next question is from the line of Rahul Hemani from Hemani Financial Services Please go ahead.

Websol Energy System Limited

April 28, 2026

Page 14 of 22

Rahul Hemani: Yes, congratulations to the team for the wonderful performance. My simple question is, are we having any plans for entering into battery energy storage system?

Sanjana Khaitan: Yes, so definitely we see strong potential in BESS given India's target of multi-gigawatt hour storage capacity by 2030, and we appreciate that it's a natural adjacency to our existing solar business and customer base. However, currently this is exploratory for us because our current priority is on executing the announced capacity and scaling up operations. So, definitely we are evaluating this and are positive on the space, but we will update you as and when there are concrete developments on this front.

Rahul Hemani: And Andhra plant, we are very confident that will be operational from June 2027, correct?

Sanjana Khaitan: So, definitely our main priority will be that no timelines of expansion move, so the teams are diligently working on that front and as I mentioned that once more details are available on that, we will definitely come back with an announcement.

Rahul Hemani: But going by the current situation, are we on track?

Sanjana Khaitan: Yes, that is what we foresee.

Rahul Hemani: Okay, thank you very much.

Sanjana Khaitan: Thank you.

Moderator: Thank you. The next question is from the line of Aanchal Jalan from Lotus Wealth. Please go ahead.

Aanchal Jalan: Hello, thank you for taking my question. So, firstly, as we will be shifting to TOPCon from Mono-PERC, what will be the improvement in revenue realization and efficiency per MW? Can you please talk about that?

Sanjana Khaitan: Yes, so right now in case of Mono-PERC, the efficiency is around 23.3%. In case of TOPCon, we are targeting 24.5% conservatively, but definitely there's potential of that number also being higher.

Sanjana Khaitan: Yes, so in terms of watt peak, right now in case of Mono-PERC, 23.3% is around 7.8 watt peak per cell. So, in case of TOPCon, that goes up to 9.3 watt peak because of the cell size and the efficiency. So, there are two factors for the increase in watt peak. One is the cell size. So, right now we are 182 into 182 when we are doing Mono-PERC. In case of TOPCon, we'll go to G12R,

so it'll become 182 into 210.

So, definitely the cell size is increasing. Moreover, in case of efficiency, from 23.3% in Mono-PERC, we are targeting 24.5% upwards in case of TOPCon. So, a combined impact of that would translate from around 7.8 watt peak per cell to around 9.3 watt peak per cell in case of TOPCon.

So, that would be the impact.

Aanchal Jalan: Can you quantify this in revenue crore per megawatt?

Websol Energy System Limited

April 28, 2026

Page 15 of 22

Sanjana Khaitan: It is very difficult to do that because as you know the prices are very dynamic. We will be bringing this capacity close to 8 months from today. So it's very difficult to know what the price of the TOPCon would be at that time. So, definitely we are confident as a result of the technology upgrade, with the efficiency and watt peak would look like, which we've already commented on. But realization would be a factor of what the price is at that point of time, which is very difficult to comment right now.

Aanchal Jalan: So, m

a'am, what are the current prices for TOPCon?

Sanjana Khaitan: It is in the vicinity of around 14 cents per watt peak for DCR.

Aanchal Jalan: In the solar industry, how much GW of demand per year will India have in the next 5 years according to your estimates?

Sanjana Khaitan: Demand number unfortunately I do not have with respect to what the demand is on a 5-year basis. But definitely cell-module capacity gap is quite visible with I think cell being at 31 GW and module being at 173 GW. So, definitely the gap between cell and module is there.

And in case of demand front, what I understand is that around the installed capacity has reached 150 GW in FY26 and still it is on an upward trend. So, I would believe that the demand is very prevalent.

Aanchal Jalan: Thank you.

Moderator: The next question is from the line of Hriday Choksey from Indus Equity Advisors. Please go ahead.

Hriday Choksey: Team Websol, congratulations on a landmark result where we've crossed INR 1,000 crores in revenues and INR 300 crores in PAT. A few quick questions. So, the first question, Sanjana, you just explained on the capacity addition across the industry. So, just wanted to get an understanding right now there's a lot of chatter of eventually we're going to reach oversupply in cell as well?

But my understanding is the announced nameplate capacity differs very much so from what is coming on as fast as possible versus how much is captive, non-captive, and the utilization is also across the industry about 80%. So, can you just give a detailed breakdown on this front?

Sanjana Khaitan: Yes, the announced capacity and the operating capacity are very different. So, even like in case of module, when we heard that the installed capacity as per the last MNRE number is close to 173 GW, most plants as per my understanding is, are operating close to 70% or even lower. So, definitely the product that actually comes into the market is 70% or 60% of the installed capacity. Same in case of cell also, ramping up takes a lot of time and efficient operations takes time. So, though the capacity can be installed as a factor of how much capex is done, but eventually to be able to run it efficiently and to be able to get an efficient product into the market is a very gradual process and specifically in case of cell, quite a lot of engineering and process steps are required.

Websol Energy System Limited

April 28, 2026

Page 16 of 22

And definitely all announced capacities will not translate into immediate supply. So, this is what our 30-year experience tells us.

Hriday Choksey: Got it. So, if we've established that capacity utilization is much lower, so then also can you give a split of captive versus non-captive across the industry usage for cells?

Sanjana Khaitan: I don't think that data would be available or rather I do not have that that how much of the 173, or rather how much of the 31 GW of cell is used captive and how much is coming in the market for module suppliers. I don't have that number right now, but I think I could say that most of the players, cell players, have integrated supply chains wherein they are using their own cells into a module and are finally selling the final module.

So, potentially I think we would be one of the players who have more of a cell capacity than a module capacity. So, definitely though I don't have the number to confirm on that, but definitely most capacities are integrated.

Hriday Choksey: Got it. So, going forward with this clear mismatch in supply and demand visible, would you say that for the next 3 or 4-year period one can assume that it would be possible for us to maintain

EBITDA margins around these levels?

Sanjana Khaitan: Yes, so as I said, I mean, 3-4 years is a very long period of time for an industry like ours where pricing and dynamics keep evolving. So, it's difficult to give a time horizon with respect to what the margin variability would look like. But as I men

tioned, in case of cell, broadly it seems that

the margin would remain with some variability over the short-term and medium-term. But definitely all this is a factor of how many capacities come on board and what the sale price looks like from an industry perspective in time to come.

Hriday Choksey: Understood. Last question. India reached a peak demand yesterday of 256 GW. Now we can also see this year PM-KUSUM 2.0 is supposed to go live. So, can you speak a little bit on the benefit we're expecting from that scheme? And additionally, I understand you've already answered we're exploring ingot and wafer, but like how keen are we on this and how soon do we expect to go live on this as well eventually?

Sanjana Khaitan: Yes, so of course wafer and ingot as per the ALMM List 3 update, it says June 2028. So, we want to match our commissioning by that time because at that point of time, I mean, it's around more than 1.5 years from today.

So, we feel of course we are definitely aggressive on this and we feel like cell was the answer a few months or years ago, now wafer and ingot is what the answer would be. So, definitely we are bullish on this and we have to bring these capacities live and we will target the June 2028 timeline for the same.

Hriday Choksey: And the benefit on the schemes like PM-KUSUM 2 going live this year?

Sanjana Khaitan: Yes, so definitely like even for the June 2026 update by the government that DCR has got mandated for projects, so definitely from the government side there has been a push to ensure that domestic manufacturing is protected and on a demand front we haven't foreseen any

Websol Energy System Limited

April 28, 2026

Page 17 of 22

challenge. In fact, our order book is growing and we remain positive that these schemes that the government is implementing is only going to increase the demand.

Hriday Choksey: All right, thanks very much. All the very best.

Sanjana Khaitan: Thank you.

Moderator: Thank you. The next question is from the line of Mukesh Aggarwal from Turbo. Please go ahead.

Mukesh Aggarwal: Hello, Yes, congratulations for the wonderful performance. My question is that since now ALMM-2 is coming, so how much sales you and assume to boost with the introduction of ALMM 2 which is implementing from June 2026?

Sanjana Khaitan: Yes, so our entire capacity right now is just DCR, which is domestic content requirement. So, our entire capacity is ALMM listed. So, eventually everything that we are bringing to the market is DCR compliant. So, 100% of our line is utilized for that.

Mukesh Aggarwal: No, no, but you told, do you have the order book of INR 1,161 crores for the financial year 2027? So, I am asking how much sale you expecting to get extra with the ALMM-2 introduction?

Sanjana Khaitan: Sir, I don't think that ALMM introduction has definitely boosted more domestic manufacturing. So, how much extra sales is difficult to say that is coming that can be directly attributable to this release, but definitely we are seeing a very strong order book ahead. And as I said, our entire line is ALMM listed. So we are definitely ready to cater to the surge in demand because of this notification.

Mukesh Aggarwal: Okay, thank you very much.

Moderator: Thank you. The next question is from the line of Nitin Shakhder from Green Capital Single Family Office. Please go ahead.

Nitin Shakhder: Hi, good afternoon. So, Sanjana, I think you answered a little bit of the question regarding BESS, but my question was more as a vision for an investor. What areas do you see the diversification possible for Websol?

Now whether it's ingot or wafer production or whether it's HJT production or whether it's smart metering, EMS, BESS, or whether it's even building integrated photovoltaics? Just as a vision strategy exercise for the year, any input from the company regarding this for a forward-looking investor which just not just look at quarter-by-quarter beat, but more like

annual performances.

Thank you.

Sanjana Khaitan: Yes, so definitely we have primarily been cell manufacturers and that is where our interest area lies. We feel that is a product we understand very well and we have a very well-qualified team who has been able to perform really well and bring up capacities in very short timeframes. So, definitely that is our primary area of interest.

However, we would like to complete the value chain by forward integrating on module, which we have done by bringing the 550 MW line, and all future capacities that we bring will also be

fully integrated. And interest area is also to go backward into wafer and ingot so that we can secure the whole value chain from that perspective. So, definitely these three products is where the primary focus remains.

With respect to BESS and other ancillary opportunities, as I mentioned, definitely it's a space which is growing and it's an ancillary product for our customer base with respect to the module, but we are concentrating more right now on the wafer, ingot, cell, and module story and we'll see how the BESS space develops for us.

Nitin Shakhder: Okay, great. Thank you. And you've created another problem for yourself by declaring such stunning results that you'd have to constantly beat yourself on QoQ, which is an extremely tough exercise, but let's look at it annually and all the best.

Sanjana Khaitan: Yes, thank you so much.

Moderator: Thank you. The next question is from the line of Pruthul Jitenbhai Shah from Anubhuti Advisors LLP. Please go ahead.

Pruthul Jitenbhai Shah: Yes, thank you for the opportunity and congrats on great set of numbers. My question was with respect to the upgradation that we are doing. So, I don't know actually whether this is answered or not. Just wanted to know what is the capex that we are incurring for upgrading to TOPCon and how many months or days of revenue loss we would be having for upgrading this?

Amrit Daga: So, Mr. Shah, we are expecting a capex around INR 250 to INR 270 crores as of now. And we are estimating that a revenue loss will be around for 15 days.

Pruthul Jitenbhai Shah: Okay, okay.

Sanjana Khaitan: Yes, it's important to note that this 15-day period is just for half the plant. So, as we mentioned, we are upgrading only one line. So, 15 days of revenue loss will happen on account of that line.

The other line will continue to function as per usual.

Pruthul Jitenbhai Shah: Got it, got it. And ma'am, for this quarter, can you give us the realization of cells and module for March?

Pruthul Jitenbhai Shah: Or you can give what current rates are in April, whatever you want to disclose.

Sanjana Khaitan: Yes, so current rates is around 13-13.5 cents per watt peak for sales and 22-22.5 cents per watt peak for module. This is what we are seeing right now.

Pruthul Jitenbhai Shah: Okay, okay. Got it, ma'am. Yes, that's it from my side. Thank you.

Sanjana Khaitan: Thank you.

Moderator: Thank you. The next question is from the line of Anik Mitra from Finnomics Solutions Private Limited. Please go ahead.

Websol Energy System Limited

April 28, 2026

Anik Mitra: Yes, so ma'am, I just want to understand the transition from your existing Mono-PERC to TOPCon. So, what is the capex involved per GW?

Sanjana Khaitan: Yes, so from 600 we are adding additional equipment to our 600 MW Mono-PERC line to upgrade it to TOPCon. So, this will increase the capacity by virtue of the upgrade by 150 MW and the planned capex for the TOPCon line is around INR 250 crores to INR 270 crores.

Anik Mitra: And madam, for your ingot and wafer, the new venture, means new addition, what sort of capex per MW peak can we estimate?

Amrit Daga: So, for ingot and wafer, we are still on the evaluation phase. We are evaluating the how much it will be the total cost for this facility and we will update you once the confi

rmed quotes are
available with us.

Anik Mitra: Okay. Sir, is there any timeline for ingot and wafer like are you considering any specific, maybe FY28, FY29, anything in your mind?

Amrit Daga: So, we've signed an MOU and we are in technical discussion and team building phase. The target is to commission ahead of the ALMM List 3 deadline of June 2028, which will mandate the Indian origin wafer for the government-funded projects. So, we are working in this ALMM-3 timeline.

Anik Mitra: Okay, got it, sir. Thank you, sir. That was from my side.

Moderator: Thank you. The next question is from the line of Hardik Jain from White Stone Financial Advisors. Please go ahead.

Hardik Jain: Yes, hi. Many congratulations for a great set of numbers and thank you for the opportunity. So, just one question. In this quarter's balance sheet, we've seen some increase in debtors and inventory. So, do you think your customers are still facing some liquidity issue and there is some issues with the off-take still?

Amrit Daga: So, let me answer your question. So, the increase in the working capital is largely driven by the inventory and the receivables. So, first on inventory, this is higher due to the capacity expansion with our cell line capacity doubling and the ramp-up of module production. In addition, the shift in product mix towards module has led to higher raw material inventory as module operations are inherently more inventory intensive.

And regarding receivables, the increase reflects also the higher business volumes and the more diversified customer base. Importantly, the portion of these receivables is backed by letter of credit from prime banks, which mitigate credit risk. So, the increase in the line of the business operations and also in line with the industry benchmark also.

Hardik Jain: But in general because we are seeing in some of the EPC players' balance sheet that the receivables are increasing across the industry, so do you think there is some issues with the payment from some of the states or from this scheme? Are your customers facing those issues?

Websol Energy System Limited

April 28, 2026

Page 20 of 22

Amrit Daga: So, we are not directly participating in the government tenders, instead, we are taking the letter of credits from these players.

Hardik Jain: Okay, thank you.

Moderator: Thank you. The next question is from the line of Saurabh Dhole from Fyers Assets. Thank you and please go ahead.

Saurabh Dhole: Yes, good evening. So, I have two questions. The first is, when you say that you're transitioning to the TOPCon technology, what impact does this have on the margins of that particular line?

And the second question is with respect to the Linton partnership. I just want to know roughly what kind of commercials etcetera, I mean, you don't have to go to exact figures, but what kind of commercial arrangements will we have here and will this be an exclusive arrangement with them?

Amrit Daga: So, regarding your first question, it will be very difficult to comment on the margin as of now on TOPCon upgrade. So, as you are aware that the TOPCon is the new technology and you will get a higher efficiency on cell. So, as of now to comment on the margin on the date of completion of TOPCon is very difficult. But obviously we expect TOPCon will yield a better margins.

Regarding tie-up with Linton, I am handing over to Sanjana.

Sanjana Khaitan: So, with Linton, of course they are manufacturers of the wafer and ingot equipment. So it's not an exclusive arrangement because, of course, that's their main business for to supply the equipment. But definitely the broad understanding is that they will be helping us with this technology and with adoption of the technology here in India and they will be training our manpower for the same.

Saurabh Dhole: And just to follow-up, in return, I mean, is there a fee involved here or is there some kind of a royalty or what is the nature of the ar

angement?

Sanjana Khaitan: Yes, I don't think we have the adequate commercials to disclose on that front with respect to what the fee structure would be. But once we have the same, we will definitely get back.

Saurabh Dhole: Sure. Thank you so much.

Sanjana Khaitan: Thank you.

Moderator: Thank you. The next question is from the line of Hriday Choksey from Indus Equity Advisors. Please go ahead.

Hriday Choksey: Thank you for the follow-up. Just wanted to confirm, so we were earmarking INR 250 crores for the TOPCon upgradation. Apart from that, in the last call I think you'd mentioned somewhere around INR 2,800 crores to INR 3,000 crores of capex for the next phase. So, that takes us to about INR 3,000-3,200 total.

And we're also talking about adding ingot wafer, so which is could be INR 300 crores, INR 400 crores, INR 500 crores for a GW. So, how confident are we on funding this entire capex expense over the next 2 to 3 years?

Websol Energy System Limited

April 28, 2026

Page 21 of 22

Sanjana Khaitan: Yes, so of course we have like surplus cash as of now for the immediate expansions. And as I said, we will be raising some amount of debt also to support the quick expansion. So, as per our projections, we don't see any concern as of now. Obviously, the idea is to manage the debt level prudently, which is what will be our interest area going forward.

Hriday Choksey: Noted. Thank you very much.

Moderator: Thank you. The next question is from the line of Ankush Agrawal from Surge Capital. Please go ahead.

Ankush Agrawal: Yes, hi. Thank you for taking my question. So, just one clarity I wanted, like one of the commentaries this quarter has been that you're trying to sort of thinking about how to sequence the new the next set of capex, which earlier was not the case. I think the commentary has showed up this quarter. So, I was trying to understand is what is driving this sort of change?

Is it because that you want to see how the industry shapes up with the new ALMM or is it in terms of sort of figuring out how to fund the project? So, just trying to understand like what has changed between last quarter and this quarter wherein the commentary has sort of shifted in terms of that you are not very clear on how to go ahead with this plan?

Sanjana Khaitan: I don't think there has been any change. Definitely we are going to expand and scale up as committed, but we do not have any additional update to give at this moment and that is why we are waiting to come back with announcements on the same. So, definitely as mentioned earlier also, we are working hard on the timeline of June 2027 and whatever capacities we've announced remain in place. So, we are just working to ensure that we are able to meet those timelines.

Ankush Agrawal: Right. But now almost this being May, so do you think that 1-year is sufficient to go from, say, zero to commercial production for this size of project? Even that now we are already starting with May and June 2027 is the target. So, do you think that 1-year is a sufficient timeframe for going from scratch to getting that line running from this size of project?

Sanjana Khaitan: Yes, I mean, we have been working on it as mentioned. It's been quite a few months that we've done a lot of homework, we've worked on the team building. We also have researched a lot on the technology, we've made multiple visits to ensure that we are well-informed of what we are getting into. So, definitely a lot of work has already been done. So, I would not treat it as starting from scratch; rather than that, I would say we are midway implementation.

Ankush Agrawal: Okay, got it. That was all. Thank you.

Moderator: Thank you. That was the last question for the day. I now hand the conference over to management for closing comments.

Sanjana Khaitan: Yes, thank you so much everyone for joining today and being a part of the call.

Moderator: Thank you. On behalf of Websol Energy System

Limited, that concludes this conference. Thank
you for joining us and you may now disconnect your lines.
